Introduction and Background

The Kewaunee County Hazard Mitigation Plan is intended to provide strategies for reducing future damages to public and private infrastructure in the county. The Kewaunee County Emergency Management Office completed the original hazard mitigation plan in 2006 and applied for and received hazard mitigation update planning grants in 2010 and 2018. This grant program is sponsored by the U.S. Department of Homeland Security - Federal Emergency Management Agency (FEMA) and is administered by the Wisconsin Department of Military Affairs - Wisconsin Emergency Management (WEM). The procedures used in preparing this plan are based on guidance provided by FEMA and WEM and should therefore be considered consistent with the requirements and procedures in the Disaster Mitigation Act of 2000.

Section 409 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (P.L. 93-228, as amended) is the impetus for involvement of state and local governments in evaluating and mitigating natural hazards as a condition of receiving federal disaster assistance. Federal Emergency Management Agency (FEMA) rules for implementing Section 409 are in 44 CFR Part 206 Subpart M.

Section 409 states that the county is obligated to try to reduce any hazard that has received relief funding in the past. Developing a hazard mitigation plan provides an opportunity for communities to meet this requirement by developing strategies for reduction of potential losses from future natural disasters. Hazard mitigation planning is the process of developing a set of actions designed to reduce or eliminate long-term risk to people and property from hazards and their effects. Completion of the update of this plan should put Kewaunee County in an advantageous position when competing for pre- and post-disaster mitigation project dollars because projects have been pre-identified. The cooperation of government, private and volunteer agencies is essential in mitigation efforts and over the long term it is hoped that implementation of this plan will save taxpayer dollars because less money is needed for post-disaster recovery activities. Furthermore, mitigation planning measures incorporated in economic or community development goals support more comprehensive and effective government. This plan evaluates the risks that natural

hazards pose to the citizens and property of Kewaunee County by presenting:

- A profile and analysis of past hazardous events
- An assessment of vulnerability of community assets
- Potential hazard mitigation strategies
- Methods for building community support and ensuring plan adoption

Plan Overview

The Kewaunee County Hazard Mitigation Plan provides background information on Kewaunee County and identifies those hazards that have occurred or could occur in the county. It includes a description of each hazard, its frequency of occurrence, appropriate actions in case of emergency and possible steps to mitigate the hazard. These hazards are the basis for the development of all county emergency plans.

A well-prepared plan allows emergency management to act swiftly and efficiently in the event of a hazard, reducing the damage and the cost incurred from displacing residents and businesses. Hazard mitigation activities will be emphasized in the plan as a major component of overall emergency management. The plan is intended to provide strategies for reducing future damages to public and private infrastructure in the county, including flood damage.

Previous Planning Efforts and Legal Basis

The Kewaunee County Emergency Management Office has completed and regularly updates a hazard vulnerability analysis (HVA). This HVA identifies all likely natural and technological hazards that might or have occurred within the county and is based on the State of Wisconsin's HVA. The local HVA does not generally include detailed mitigation strategies for the identified hazards.

There have also been plans and ordinances completed by individual Kewaunee County departments or municipalities, some of which were used as reference materials for this plan, including:

Chapter 17 Erosion Control and Stormwater
Management

Chapter 20 Floodplain Zoning

The local HVA serves as the starting point for the hazard mitigation plan. Other data on historical events is gathered from the National Weather Service's storm report database, recent news reports, local resources (e.g., website; local community ordinances; local plans such as the comprehensive plan, stormwater management plans, etc.), the FEMA Region V mitigation survey and from the memories of the local planning team members. Team members are presented with this educational background data and asked to rank their concern (likelihood of future occurrences and amount of disruption/damage should it occur) on a five-point scale (very high, high, medium, low, very low). From that, team members, members of the community, survey respondents and other planning

⁵ https://baylakerpc.org/download_file/view/298/254

⁶ <http://www.townofredriver.org/Ordinances.htm>

participants are asked to determine hazard mitigation strategies that might benefit their communities. Local existing plans are referenced again at this time, with the members and authors of these plans (e.g., comprehensive, stormwater management) serving as core members of the workgroup committee. The selected mitigation strategies are recorded and detail in each chapter as well as in the table in Appendix E.

Mitigation strategies are reviewed over the five years of the plan's life by the leadership staff from the applicable departments (e.g., Emergency Management, Sheriff's Office/Communications, Highway, Land and Water Conservation and Land Information) with the elected leaders from the jurisdictions to triage projects and determine what can and should be done within the planning period. These options are usually discussed in open meetings prior to implementation, as required by Wisconsin state law. The determining factor for most projects is obviously budget availability. The units of government have several options for funding implementation including grants, special taxing authority (for the project and/or any matching funds), general purpose revenue from existing budgets and regulatory authority, which can be used to require that an individual or business complete the project using their funds. The units of government use or improve, if necessary, the mechanisms described above to ensure the implementation of hazard mitigation ideas.

Plan Preparation, Adoption and Maintenance

The Kewaunee County Emergency Management Director contracted with Emergency Planning, Training and Exercise Consulting (EPTEC, Inc.) to draft this plan. A Hazard Mitigation Workgroup was organized from the members of the standing Land Records Committee to oversee the completion of this plan. The committee members include:

- Tracy Nollenberg, Kewaunee County Emergency Management
- Perry Pavlat, Town of Casco
- Joe Lukes, Town of Casco
- Gary Paape, Town of Ahnapee
- Tom Stoller, Town of Ahnapee
- Troy Alsteen, Village of Casco
- Mike Sampo, Town of Red River
- Todd Every, Kewaunee County Highway Department

- David Barrett, Town of Luxemburg
- Linda Jonet, Town of Luxemburg
- Brian Paplham, Town of Pierce
- Peter Haack, City of Algoma Utility
- Wayne Schmidt, City of Algoma
- Cindy Kinnard, Kewaunee County Public Health
- Lee Dachelet, City of Algoma
- Lenora Borchardt – EPTEC, Inc. (Contractor)

An informational brochure was created and copies were distributed throughout the community at local community gathering points such as municipal halls, libraries, etc. Meetings were held with chief elected from the municipalities to explain and gather input regarding the program (e.g., previous occurrences, mitigation strategies.) The FEMA Region V survey was sent to every Kewaunee County city, village and town clerk for distribution to the elected officials for discussion, review and completion. Key county departments (i.e., planning, LWCD, highway, Sheriff's) also received the survey with a request for completion; the completed county and municipal surveys were compiled and the results, along with the cover letter, are in Appendix G.

The committee met to evaluate and incorporate input from local officials and then to review and provide input on the progress of the plan. A public notice was placed in the newspaper to invite members of the public, local officials, academia and business and industry leaders to review the plan. Comments received were reviewed by the workgroup and incorporated as appropriate. A working draft of the draft plan was distributed to the County Emergency Management Directors from the contiguous counties (i.e., Brown, Door and Manitowoc Counties) and they were asked for input and if they would like to participate in the completion of the plan; offers were declined. A copy of the mitigation brochure and a list of meeting dates and informational sessions to gather public and official input can be viewed in Appendix G.

The Kewaunee County Hazard Mitigation Plan Workgroup reviewed the previous plan and past events records (generally gathered from the National Weather Service); a consensus was reached on the anticipated probability of future events. This probability was designated as “very high,” “high,” “medium,” “low” or “very low” by the workgroup based on their evaluation and experience with the data.

The hazard mitigation strategies from the previous version of this plan were reviewed and progress is reported in Appendix D. The workgroup also, after reviewing the updated draft plan, selected the potential new mitigation projects, which are listed in Appendix E (Summary of Mitigation Strategies) and discussed in more detail in each chapter's Hazard Mitigation Strategies section. The workgroup participants were given the *Mitigation Ideas: Possible Mitigation Measures by Hazard Type* (Mitigation Ideas, FEMA-R5, 9/02) booklet as an aid to generating ideas. All of the ideas generated during the workgroup meetings were incorporated into the plan and can be found in the Hazard Mitigation Strategies section of each chapter and are summarized in Appendix E. Based on the information collected, each of these projects was assigned a "very high," "high," "medium," "low" or "very low" priority based on the workgroup's internal consensus assessment during a discussion of the balances of risk, reward, cost effectiveness (cost benefit) and likelihood of local will and funding (local or grant) to complete the strategy.

The municipal leaders were briefed regarding the need to formally adopt this plan as a prerequisite for future mitigation funding eligibility. A draft was sent to Wisconsin Emergency Management (WEM) for review and tentative approval. Based on WEM's comments, a final draft plan was completed and forwarded to FEMA for determination of approvability. Once deemed approvable by FEMA, a general meeting was held to review the plan with members of the public, local officials, academia and business and industry leaders. Information and adoption paperwork was provided to the municipal leaders advising them of the need to formally adopt this plan as a prerequisite for future mitigation funding eligibility.

A resolution has been passed by the Kewaunee County Board, the Cities of Algoma and Kewaunee and the Villages of Casco and Luxemburg to accept this plan. The towns were also given an opportunity to adopt this plan and the Towns of Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Pierce, Red River, and West Kewaunee chose to adopt it. Scanned copies of the resolutions adopting the plan can be found in Appendix C. The final plan has been submitted to WEM for review and certification and notice of acceptance has been received of FEMA plan approval as of 9 April 2020.

The Disaster Mitigation Act of 2000 requires the monitoring, evaluation and updating of the hazard mitigation plan every five years. This hazard mitigation plan is designed to be a "living"

document and therefore will be reviewed and updated within five years from its approval date. The Kewaunee County Hazard Mitigation Plan Workgroup will provide leadership and guidance throughout the plan's life cycle (i.e., monitoring, evaluating and updating.) Updates will allow municipal leaders and the public to provide input into the process. The public will be notified of this opportunity via legal public notices.

The process for integrating hazard mitigation actions into other planning mechanisms will be led by the County Emergency Management Director. As she receives information between the five-year update periods (e.g., comprehensive or capital improvement plans) that might be included, it will be added to Appendix H: Inter-Revision Updates. Kewaunee County Emergency Management maintains responsibility and is the point of contact for all issues (e.g., monitoring, updating and evaluating the effectiveness) regarding this plan. Municipalities can contact the County Emergency Management Director to add updated local information to Appendix H at any time. Furthermore, the county Emergency Management Director may solicit updates from the plan's stakeholders (county offices, municipalities, the public, etc.). The solicitation would seek to determine if there are new elements for the mitigation plan as well as any plans (new or updates) in which the mitigation plan can and/or will be used as a source plan. Comments will be received and discussed at the county's Emergency Management committee meeting. Note that after a disaster, the Emergency Management committee may also meet to discuss mitigation strategies that might be applicable. These same stakeholders will be invited to fully participate in the five-year plan update, which will be detailed in the updated plan documents and will fully conform to FEMA's requirements.

During the plan's lifecycle, the county and incorporated municipalities will consider the strategies listed in Appendix E as they annually prioritize "regular" maintenance projects, as they set their annual budgets, after a disaster period and as grants become available that might help off-set the costs of some of the strategies listed within the plan. The latter will be instigated by notice of these opportunities by the County Emergency Management Director. These projects will be reported in the annual letter to the County Emergency Management Director. The Director will keep and compile the inter-revision data for inclusion in the five-year update, which will be coordinated through County Emergency Management beginning at least 18 months prior to expiration and at which time they will report on their progress towards meeting the hazard

mitigation goals. The update will bring together many of the same workgroup members as well as any new stakeholders (e.g., elected officials, businesses, academia, members of the public) who respond to the invitation to participate and have an interest in mitigation planning.

The plan participants also recognize this document as an important planning tool within the community and will use this plan as a reference as they complete and update community ordinances and other planning such as zoning, shoreland, floodplain, wetland, park and recreation, sustainability, and farmland preservation. The County Emergency Management Director and the Kewaunee County Land and Water Conservation Department will use this plan as they update the Kewaunee County Comprehensive Plan as well as community ordinances such as zoning, shoreland, floodplain, wetland, etc. and in other stand-alone plans such as those for park and recreation, sustainability and farmland preservation and will refer to it as they are involved in the planning and other preparedness activities of their municipalities. Many of these plans are on a regular updating cycle and as emergency management is notified that they are up for renewal, they will provide any relevant planning materials (from the hazard mitigation plan and any additional information received since the plan's approval). Municipalities with planning departments have also committed to referring to the mitigation plan in their zoning updates, flood and shoreland planning and in their comprehensive plans. After this plan has passed its reviews from Wisconsin Emergency Management (WEM) and the Federal Emergency Management Agency (FEMA) and is approved, the county and its municipalities will have working copies. Kewaunee County Emergency Management will also refer to this plan in their emergency preparedness activities.

Physical Characteristics of Kewaunee County

General Community Introduction

Kewaunee County was inhabited by the Native American Potawatomi for more than three hundred years before Jean Nicolet set foot on the Kewaunee shore in 1634. The name "Kewaunee" is Potawatomi for "We are lost." Native Americans lost in the fog offshore would cry out "Kewaunee, Kewaunee" hoping to be guided to safety by answering calls from the shore.

With communities founded by immigrants from many nations, including Bohemia, Belgium, Czechoslovakia, Germany, Ireland, Luxemburg and Poland, Kewaunee County contributes to the largest concentration of widely diverse old-world settlements in the United States and is included as part of the Wisconsin Ethnic Settlement Trail.

The countryside is dotted with steeples of churches established by the early settlers. Many have been rebuilt or reconstructed over the years and continue to serve the descendants of their original congregations. Area history is also well-preserved and displayed in more than 100 restored historic homes, churches and commercial buildings, from 18th century log cabins to elegant Victorian mansions and a unique 19th century dungeon and jailhouse museum.

Kewaunee County's two Lake Michigan harbors (Algoma and Kewaunee) have enjoyed a long and colorful maritime past, serving military, commercial and passenger vessels of many nations for more than six centuries. Vessels built by Kewaunee County shipbuilders have sailed the Great Lakes and the seven seas. From the turn of the 20th century through the 1940's, the area's commercial fishing fleet harvested great nets full of fish from Lake Michigan.

Kewaunee County offers a plethora of outdoors activities and sports for both residents and the growing tourism market. Some of the most popular activities include charter fishing for trophy trout and salmon and boating and sailing from the county's harbors and marinas. Kewaunee County's inland lakes and streams and the waters of Lake Michigan offer swimming, fishing, boating, canoeing, scuba-diving and water-skiing. Inland lakes and wetlands harbor

Physical Characteristics

unique plant and animal (e.g., shorebirds, waterfowl, amphibians, fish, fur-bearing mammals) communities nature observers. Fishing in Kewaunee County lakes yields rainbow trout, perch, bluegills, crappies, bass, bullheads and tiger muskies.

The county's scenic rural roads and the Ahnapee State Trail offer miles of cycling, hiking and cross-country skiing. The Crescent Beach Boardwalk offers views of Lake Michigan and the Algoma shoreline and the Nature Walk, a 1,500-ft. wooden walkway along the Kewaunee River north of Kewaunee, leads to a scenic observation deck.

Kewaunee County provides a wide range of dry-land sports facilities including two public golf courses, a Frisbee golf course, a bowling center, indoor and outdoor Field Archery Ranges, a 5-Stand Sporting Clay Range, two Trap Ranges, a Rifle Range, outdoor tennis courts, an 18-hole miniature golf range, miles of cross-country ski trails, ice-skating rinks, a park with T-Bar Lift for downhill skiing and a tubing run and 123 miles of snowmobile trails.⁷

Plan Area

Kewaunee County is located in east-central Wisconsin. It is bordered on the east by Lake Michigan, on the south by Manitowoc County, on the west by Brown County and on the north by Door County. A small section of the northwest corner of Kewaunee County also touches the Bay of Green Bay.

Kewaunee County is approximately 342.64 square miles making it the 65th (out of 72) largest county in Wisconsin. In Wisconsin, there are three types of sub-county, full-service local government units: towns, which are unincorporated, and villages and cities, which are incorporated. Kewaunee County contains the Cities of Algoma and Kewaunee; the Villages of Casco and Luxemburg and the Towns of Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Pierce, Red River and West Kewaunee. (See Appendix A for a map of Kewaunee County.) The County and all incorporated municipalities have adopted the updated plan. The Towns of Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Pierce, Red River, and West Kewaunee have also

⁷ <http://www.explorewisconsin.com/countypages/kewaunee.html>

adopted the plan. (Copies of the adoptions can be found in Appendix C.)

Geology

Kewaunee County's landscape is generally undulating to gently rolling. The county covers an area of 331 square miles, making it the 65th largest (or 7th smallest) out of 72 Wisconsin counties. It lies on a limestone rock layer known as the Niagara escarpment, which drops sharply toward Green Bay while sloping gently across the county to Lake Michigan. Bedrock outcrops are numerous in the northwestern part of the county.

Northeastern Wisconsin was glaciated several times. Glacial ice scoured the bedrock in some places and deposited more than 100 feet of drift in other places. In areas where the bedrock is at or very near the surface there is a serious hazard of pollutants entering the ground water through fissures and crevices in the bedrock. Approximately 53% of the land area within Kewaunee County exhibit some degree of contamination potential for pollutants entering the groundwater.

The physiography of Kewaunee County is controlled largely by the Niagara Dolomite Formation that underlies most of the county. The county lies in an area of the State classified as having shallow "karst" topography. This type of topography is characterized by shallow soil depth (5 feet or less) to the underlying Niagara Dolomite (limestone) bedrock. In most landscapes, rivers flow across the surface of the land. However, in karst landscapes, rainwater and snowmelt readily flows downward through joints in permeable limestone rocks and invisibly attacks them over time through a solution process called "carbonation". Carbon dioxide from the atmosphere and soil combines with falling rain and snowmelt to form a weak carbonic acid that dissolves calcium carbonate, the main component of limestone. In carboniferous limestone, this process enlarges vertical and horizontal joints and creates complex underground channels. These channels provide easy conduits for transporting unfiltered groundwater contaminants, such as sediment, chlorides, nitrates, bacteria and other microorganisms to local drinking water aquifers.⁸

⁸ Kewaunee County Land & Water Resource Management Plan 2010 – 2019: Executive Summary

Topography

Wisconsin lies in the upper Midwest between Lake Superior, the upper peninsula of Michigan, Lake Michigan and the Mississippi and Saint Croix Rivers. Its greatest length is 320 miles, greatest width 295 miles for a total area 56,066 square miles. Glaciation has largely determined the topography and soils of the state, except for the 13,360 square miles of driftless area in southwestern Wisconsin. The various glaciations created rolling terrain with nearly 9,000 lakes and several areas of marshes and swamps. Elevations range from about 600 feet above sea level along the Lake Superior and Lake Michigan shores and in the Mississippi floodplain in southwestern Wisconsin to nearly 1,950 feet at Rib and Strawberry Hills.

The Northern Highland, a plateau extending across northern Wisconsin, is an area of about 15,000 square miles with elevations from 1,000 to 1,800 feet. This area has many lakes and is the origin of most of the major streams in the state. The slope down to the narrow Lake Superior plain is quite steep. A comparatively flat, crescent-shaped lowland lies immediately south of the Northern Highland and embodies nearly one-fourth of Wisconsin. The uplands of southwestern Wisconsin west of the ridges and lowlands and south of the Central Plains make up about one-fourth of the state. This is the roughest section of the state, rising 200 to 350 feet above the Central Plains and 100 to 200 feet above the Eastern Ridges and Lowlands. The Mississippi River bluffs rise 230 to 650 feet. The eastern ridges and lowlands to the southeast of the Central Plains are the most densely populated and have the highest concentration of industry and farms.⁹

Kewaunee County's landscape is generally undulating to gently rolling. It lies on a limestone rock layer known as the Niagara escarpment, which drops sharply toward Green Bay while sloping gently across the county to Lake Michigan. Glacial action was responsible for the outstanding topographic feature, a scenic kettle moraine belt that runs through the central part of the county. This belt extends, almost continuously, southward to Walworth County on Wisconsin's southern boundary.¹⁰

⁹ <http://www.aos.wisc.edu/~sco/clim-history/state/stateclimate.html>

¹⁰ <http://www.rootsweb.com/~wikewaun/general.htm>

Approximately eighty percent of Kewaunee County has slopes of less than six percent and about twelve percent of the county has slopes of six to twelve percent. Approximately eight percent of the county has slopes of more than twelve percent.

Lake Michigan, which borders the county on the east, has a mean lake elevation of 580 feet above sea level. The land elevation rises to about 900 feet in Lincoln and Montpelier Townships.¹¹

Lake Michigan

Lake Michigan is the third largest Great Lake by surface area and the sixth largest freshwater lake in the world. Because Lake Michigan is joined to Lake Huron at the Straits of Mackinac, they are considered one lake hydrologically.

Shoreline erosion and bluff stability conditions are important considerations in planning for the protection and sound development and re-development of lands located along the Lake Michigan shoreline. Most of the erosion processes along the Lake Michigan shoreline are due to natural weathering. However, human activities can influence this process, causing erosion to accelerate or decelerate. Various factors contribute to bluff and beach erosion. Broad, indirect factors such as changing climate and lake levels affect the more specific, direct factors such as wave action, groundwater seepage, stormwater runoff rates/flow volumes, freeze-thaw action, lake ice movement, the type of bluff and beach material and the type of vegetative cover. Although nothing can be done to eliminate bluff erosion, control measures such as vegetative covers and drainage systems can be implemented to slow down this natural process.¹²

Climate

The Wisconsin climate is typically continental with some modification by Lakes Michigan and Superior. Winters are generally cold and snowy and summers are warm. About two-thirds of the annual precipitation falls during the growing season; this is normally adequate for vegetation although there are occasional droughts. The climate favors dairy farming and the primary crops are corn, small grains, hay and vegetables. Storm

¹¹ Kewaunee County Land & Water Resource Management Plan 2010 – 2019: Executive Summary

¹² Ozaukee Land Guide, 2001

tracks generally move from west to east and southwest to northeast.

The average annual temperature varies from 39°F in the north to about 50°F in the south with statewide extreme records of 114°F (Wisconsin Dells, 7/13/1936) and minus 55°F (Couderay, 2/2 & 4/1996.) During more than one-half of the winters, temperatures fall to minus 40°F or lower and almost every winter temperatures of minus 30 or colder are reported from northern stations. Summer temperatures above 90 average two to four days in northern counties and about 14 days in southern districts. During marked cool outbreaks in summer months, the central lowlands occasionally report freezing temperatures.

The freeze-free season ranges from around 80 days per year in the upper northeast and north-central lowlands to about 180 days in the Milwaukee area. The pronounced moderating effect of Lake Michigan is well-illustrated by the fact that the growing season of 140 to 150 days along the east-central coastal area is of the same duration as in the southwestern Wisconsin valleys. The short growing season in the central portion of the state is attributed to a number of factors, among them an inward cold air drainage and the low heating capacities of the peat and sandy soils. The average date of last spring freeze ranges from early May along the Lake Michigan coastal area and southern counties to early June in the northernmost counties. The first autumn freezes occur in late August and early September in the northern and central lowlands and in mid-October along the Lake Michigan coastline. However, a July freeze is not entirely unusual in the north and central Wisconsin lowlands.

The long-term mean annual precipitation ranges from 30 to 34 inches over most of the Western Uplands and Northern Highlands, then diminishes to about 28 inches along most of the Wisconsin Central Plain and Lake Superior Coastal area. The higher average annual precipitation coincides generally with the highest elevations, particularly the windward slopes of the Western Uplands and Northern Highlands. Thunderstorms average about 30 per year in northern Wisconsin to about 40 per year in southern counties and occur mostly in the summer. Occasional hail, wind and lightning damage are also reported.

The average seasonal snowfall varies from about 30 inches at Beloit to well over 100 inches in northern Iron County along the steep western slope of the Gogebic Range. Greater average

snowfall is recorded over the Western Uplands and Eastern Ridges than in the adjacent lowlands. The mean dates of first snowfall of consequence (an inch or more) vary from early November in northern localities to early December in southern Wisconsin counties. Average annual duration of snow cover ranges from 85 days in southernmost Wisconsin to more than 140 days along Lake Superior. The snow cover acts as protective insulation for grasses, autumn seeded grains, alfalfa and other vegetation.¹³

In Kewaunee County, the median date of the last frost in spring is May 10th, the median date of the first frost in fall is October 8th and the range of the growing season is from 133 to 182 days with 156 days being the median.¹⁴

Climate Normals and Growing Season Summary¹⁵

In 2012, the Wisconsin Department of Health Services (DHS), Bureau of Environmental and Occupational Health (BEOH) was awarded a grant to study and prepare for anticipated climatic effects of the public's health. The Wisconsin Climate and Health Profile Report highlights evidence-based data related to extreme weather events, corresponding health outcomes and the development of projects and best practices to adapt to and prepare for future extreme weather events.

Over the past 60 years Wisconsin has become warmer and wetter, especially during the winter months. Evidence and research drawn from the Wisconsin Initiative on Climate Change Impacts (WICCI) suggest that climate-sensitive human health impacts will likely be affected by precipitation changes, heat extremes, drought, winter weather changes, disease vectors, surface water and groundwater. Those most vulnerable to these changes include the very young, elderly, persons with chronic disease (e.g., asthma), persons of low socio-economic status, persons with mental health issues and those who are socially isolated.

Possible impacts during the four seasons include:

¹⁵ Data Provided by the Midwestern Regional Climate Center <http://mcc.sws.uiuc.edu/>

- Spring - More frequent and intense rain events may lead to more flooding with health impacts such as stress and mental health disorders; foodborne and waterborne illnesses; injuries; drowning; and death.
- Summer - Southern Wisconsin may experience approximately 28 more days exceeding 90 degrees Fahrenheit. Health impacts can include heat stress, respiratory disease, allergic reactions and death.
- Fall - Extended periods of warming could cause more drought with health impacts including water and food insecurity; respiratory distress; allergic reactions; and death.
- Winter - Warmer winters might cause more ice, sleet and rain. Health impacts may include traffic accidents, power outages, injuries and death.¹⁶

Hydrology

The land in Wisconsin drains into Lake Superior, Lake Michigan and the Mississippi River. The Mississippi and St. Croix Rivers form most of the western boundary. About one-half of the northwestern portion of the state is drained through the Chippewa River, while the remainder of this region drains directly into the Mississippi or St. Croix and into Lake Superior. The Wisconsin River has its source at a small lake nearly 1,600 feet above mean sea level on the Upper Michigan boundary and drains most of central Wisconsin. Most of its tributaries also spring from the many lakes in the north, except for the Rock River, a Mississippi River tributary which flows through northern Illinois, eastern Wisconsin drains into Lake Michigan.

Most of the streams and lakes in the state are ice-covered from late November to late March. Snow covers the ground in practically all the winter months except in extreme southern areas. Flooding is most frequent and most serious in April due to the melting of snow and spring rains. During this period, flood conditions are often aggravated by ice jams which back up the flood waters. Excessive rains of the thunderstorm type sometimes produce tributary flooding or flash flooding along the smaller streams and creeks.¹⁷

Groundwater reservoirs are recharged by direct precipitation. Spring is a prime time for recharge because evapotranspiration is

¹⁶ *Wisconsin Climate and Health Profile Report*, 2014, WI Department of Health Services, Bureau of Environmental and Occupational Health <http://www.dhs.wisconsin.gov/publications/P0/P00709.pdf>

¹⁷ <http://www.uwex.edu/sco/state.html>

low and melting snow and rainfall infiltrate and percolate the water table on unfrozen ground. Fall is another prime time for high recharge. During the summer, groundwater levels drop because precipitation is lower causing losses to evaporation and transpiration to exceed precipitation. In addition, groundwater is lost to surface waters by discharge in the form of springs.¹⁸ The winter period normally lacks infiltration because of frozen ground.

Groundwater resources constitute an extremely valuable element of the natural resource base of Kewaunee County. The groundwater reservoir not only sustains lake levels and provides the base flow of streams in the county but also comprises a major source of water for domestic, municipal and industrial water users. Like surface water, groundwater is susceptible to depletion in quantity and to deterioration in quality.

There are 15 lakes in Kewaunee County covering a total of 251 acres (0.39 square miles.) There are also four rivers that flow in the county including the Ahnapee, East Twin, Kewaunee and the Neshota. (See Appendix A for a map of county waterways.)

The major watershed is the Lake Michigan Watershed. The minor watersheds are the Ahnapee River, the East Twin River, the Kewaunee River, the Red River and Little Sturgeon Bay, the Stony Creek and the West Twin River Watersheds. (See Appendix A for a map of county watersheds.)

Wisconsin is a state with a large quantity of groundwater and is a critical resource both statewide and within the county. It is the main source of drinking water for 70% of Wisconsin residents and 95% of Wisconsin communities. From 1979 to 2005, total water use in Kewaunee County has increased from 2.7 million gallons per day to 5.0 million gallons per day. The increase in total water use is due to fluctuations of usage in all categories with an increase in aquaculture in 2005. The proportion of county water use supplied by groundwater has been consistently above 96% during the period 1979 to 2005.¹⁹

The state has nearly 11,500 public water systems which meet the daily water needs of about 4 million people. Public water systems

¹⁸ DeVaul, 1967.

¹⁹ <https://wi.water.usgs.gov/gwcomp/find/kewaunee/index.html>

that are owned by a community are called municipal water systems and Kewaunee County has three: ²⁰

- Algoma Waterworks
- Kewaunee Waterworks
- Luxemburg Waterworks

In addition to the public water systems, about 850,000 private wells provide drinking water to Wisconsin's population. Unlike public water systems, protection and maintenance of a private well is largely the responsibility of homeowners.

Groundwater is the primary source of drinking water for most Kewaunee County residents, conveyed through private wells or municipal water systems. As with 70% of the state, the sand and gravel aquifer is the main source of groundwater. This aquifer includes primarily glacial deposits of unconsolidated sand and gravel. It is not a continuous layer, but rather is deposited in lenses or layers of sand and gravel interspersed with other fine-grained or low permeability deposits. As a result, well yields vary and depend primarily on the permeability and thickness of the sand and gravel at a particular location. The Status of Groundwater Quantity Report states that groundwater in general is abundant in Kewaunee County.²¹

Kewaunee County obtains all of its domestic drinking water from groundwater sources, including both municipal and private wells. Recharge of the County's aquifers is derived almost entirely from locally occurring precipitation, giving our citizens control over, and responsibility for, their groundwater. Ways to protect groundwater include:

- Wellhead Protection Plans and Ordinances: Wellhead protection plans are developed to achieve groundwater pollution prevention measures within public water supply wellhead areas. A wellhead protection plan uses public involvement to delineate the wellhead protection area, inventory potential groundwater contamination sources, and manage the wellhead protection area. All new municipal wells are required to have a wellhead protection plan. A wellhead protection ordinance is a zoning ordinance that implements the wellhead protection plan by controlling land

²⁰ <https://wi.water.usgs.gov/gwcomp/find/kewaunee/watersystems.html>

²¹ WDNR, 1997

uses in the wellhead protection area. Of the three municipal water systems, none have a wellhead protection plan nor do any have a wellhead protection ordinance.

- Animal Waste Management Ordinances: Most Wisconsin counties, including Kewaunee County, have adopted an animal waste management ordinance that applies to all unincorporated areas of the county (areas outside of city and village boundaries). While the purposes of such ordinances vary among counties, a key purpose is often to protect the groundwater and surface water resources. This is accomplished by regulations such as:
 - Permitting of animal waste storage facilities;
 - Permitting of new and expanding feedlots;
 - Nutrient management;
 - Prohibiting:
 - Overflow of manure storage structures;
 - Unconfined manure stacking or piling within areas adjacent to stream banks, lakeshores, and in drainage channels;
 - Direct runoff from feedlots or stored manure to waters of the state;
 - Unlimited livestock access to waters of the state where high concentrations of animals prevent adequate sod cover maintenance.
- Nitrate - Aquifers that are close to the land surface have limited natural protection which makes them vulnerable to pollution. From 1990-2006, 96% of 126 private well samples collected in Kewaunee County met the health-based drinking water limit for nitrate-nitrogen (NO₃-N).²²

In 2006, the Wisconsin DNR and DATCP reported that NO₃-N is the most widespread groundwater contaminant in Wisconsin and that the nitrate problem is increasing both in extent and severity with 80% of nitrate inputs originate from manure spreading, agricultural fertilizers, and legume cropping systems. Septic systems can also be a significant nitrate source in densely populated areas, areas where fractured bedrock is near the surface, or areas with coarse-textured soils. Additionally, concentrations of NO₃-N in

²² <https://wi.water.usgs.gov/gwcomp/find/kewaunee/index.html>

private wells frequently exceed the drinking water limit. For example, in 2005 11.6% of 48,818 private wells exceeded the nitrate limit.

Land use affects nitrate concentrations in groundwater with a study of over 35,000 private well samples being three times more likely to be unsafe to drink due to high nitrate in agricultural areas, especially those with sandy areas/highly permeable soils, than in forested areas. Groundwater with high nitrate from agricultural lands is more also more likely to contain pesticides than groundwater with low nitrate levels.

- Pesticides - A pesticide is any substance used to kill, control or repel pests or to prevent the damage that pests may cause. Included in the broad term “pesticide” are herbicides to control weeds, insecticides to control insects, and fungicides to control fungi and molds. Pesticides are used by businesses and homeowners as well as by farmers, but figures for the amounts and specific types of pesticides used are not generally available on a county-by-county basis. A 2005 report indicates that approximately 13 million pounds of pesticides are applied to major agricultural crops in Wisconsin each year, including over 8.5 million pounds of herbicides, 315,000 pounds of insecticides, one million pounds of fungicides, and 3 million pounds of other chemicals (this last category applied mainly to potatoes). The report also shows that herbicides are used on 100% of carrots for processing, 99% of potatoes, 98% of cucumbers for processing, 98% of soybeans, 97% of field corn, 89% of snap beans for processing, 87% of sweet corn, and 84% of green peas for processing. Insecticides are used on 97% of potatoes, 96% of carrots, and 88% of apples. Fungicides are used on 99% of potatoes, 88% of carrots, and 89% of apples.

A 2002 study estimated that 33% of private drinking water wells in the region of Wisconsin that includes Kewaunee County contained a detectable level of an herbicide or herbicide metabolite. Pesticides occur in groundwater more commonly in agricultural regions, but can occur anywhere pesticides are stored or applied. There are 2,410 acres of land within the county that are

in an atrazine prohibition area. There are no atrazine prohibition areas in Kewaunee County.²³

- Arsenic - Arsenic is an element that occurs naturally in some of Wisconsin's aquifers and may contaminate well water drawn from those aquifers. It is a particular problem in parts of the Fox River valley of northeastern Wisconsin. However, arsenic has been detected in wells in every county in Wisconsin, and arsenic concentrations greater than the drinking water limit of 10 µg/L (micrograms per liter, or parts per billion) have been documented in 51 of Wisconsin's 72 counties. 100% of 31 private well samples collected in Kewaunee County met the health standard for arsenic. Of the four water samples analyzed for arsenic in Kewaunee County, none have detectable arsenic and no samples are greater than the recently reduced drinking water limit of 10 µg/L (or parts per billion). Most private wells in the county have unknown arsenic levels.
- Contaminated Groundwater and/or Soil - Properties that were or are contaminated with hazardous substances can be found using the WDNR's Bureau for Remediation and Redevelopment Tracking System (BRRTS).²⁴ Kewaunee County has nine open leaking underground storage tank (LUST) sites which have contaminated soil and/or groundwater with petroleum, which includes toxic and cancer-causing substances. However, given time, petroleum contamination naturally breaks down in the environment. There are 11 environmental repair (ERP) sites which are sites other than LUSTs that have contaminated soil and/or groundwater. Examples include industrial spills or dumping, buried containers of hazardous substances, and closed landfills that have caused contamination. There is also one Voluntary Party Liability Exemption (VPLE) site.²⁵
- Concentrated Animal Feeding Operations (CAFO) - There are 11 concentrated animal feeding operations (i.e., greater than 1,000 animal units) in Kewaunee

²³ <https://wi.water.usgs.gov/gwcomp/find/kewaunee/index.html>

²⁴ <https://dnr.wi.gov/topic/Brownfields/botw.html>

²⁵ <https://wi.water.usgs.gov/gwcomp/find/kewaunee/index.html>

County.²⁶ CAFOs are required under their Wisconsin Pollutant Discharge Elimination System (WPDES) permits to practice proper manure management and ensure that adverse impacts to water quality do not occur. Permit applicants must submit detailed information about the operation, a manure management plan, plans and specifications for all manure storage facilities, and a completed environmental analysis questionnaire. Once a WPDES CAFO permit is issued, operators must comply with the terms of the permit by following approved construction specifications and manure spreading plans, conducting a monitoring and inspection program, and providing annual reports. Other potential groundwater contaminants from agriculture include fertilizers and pesticides. Large amounts of nitrogen fertilizers are used when fields are planted continuously with corn, and they can leach into groundwater as nitrate.²⁷

- Licensed Landfills and Superfund Sites – There is one licensed landfill and no Superfund sites in Kewaunee County. In 1980, Congress passed the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as the Superfund law. The Superfund law created a tax on the chemical and petroleum industries, which went into a trust fund to help pay for cleaning up abandoned or uncontrolled waste sites. The U.S. Environmental Protection Agency (EPA) administers the Superfund trust fund and works closely with state and local governments and tribal groups to remediate sites that may endanger public health or the environment. The contamination at many of these sites was created years ago when environmental regulations were virtually nonexistent and companies dumped or emitted hazardous materials freely into the environment. Years later the threat to humans and the ecosystems remains so great that the sites need to be cleaned up.

Since much of this contamination was caused many years ago, it can be hard to find the parties responsible, or the parties responsible may be unwilling or unable to pay for the cleanup. In these cases, the Superfund trust fund can be used to pay for most of the cleanup process.

²⁶ <https://wi.water.usgs.gov/gwcomp/find/kewaunee/index.html>

²⁷ <https://dnr.wi.gov/topic/AgBusiness/CAFO/>

States must pay for a portion of such cleanups. CERCLA also provides EPA with enforcement tools to compel those responsible for causing the contamination to pay for the cleanup, including the issuance of administrative orders. If the trust fund is used, then EPA and the state may go to court to recover their expenditures from those who are responsible.

- Cleanup -
 - Petroleum Environmental Cleanup Fund Award - The Petroleum Environmental Cleanup Fund Award (PECFA) program was created in response to enactment of federal regulations requiring release prevention from underground storage tanks and cleanup of existing contamination from those tanks. PECFA is a reimbursement program returning a portion of incurred remedial cleanup costs to owners of eligible petroleum product systems, including home heating oil systems. As of May 31, 2007, over \$7 million has been spent on petroleum clean up in Kewaunee County, which equates to \$348 per county resident.
 - Nitrate Removal Systems – No municipal water systems in Kewaunee County have spent money to reduce nitrate levels. As of 2005, over 20 municipal water systems in Wisconsin have spent over \$24 million reducing nitrate concentrations in municipal water systems.

WDNR's Outstanding and Exceptional Resource Waters Program provides a designation for Wisconsin's cleanest waters. An outstanding resource water is defined as a lake or stream that has excellent water quality, high recreational and aesthetic value, high quality fishing and is free from point source or non-point source pollution. An exceptional resource water is defined as a stream that exhibits the same high-quality resource values as an outstanding resource water but that may be impacted by point source pollution or that may have the potential for future discharge from a small sewer community. Outstanding resource waters in Kewaunee County are:²⁸

- Little Scarboro Creek – All

²⁸ http://dnr.wi.gov/topic/SurfaceWater/oerw/orwerw_county.pdf

Exceptional resource waters in Kewaunee County are:²⁹

- Casco Creek – From T24N R24E S19 downstream of Rock Ledge to Kewaunee River
- Krok Creek (E Twin River) – All above Hwy. 29
- Rogers Creek - All

Kewaunee County contains parts of six watersheds (East Twin River, West Twin River, Stony Creek, Ahnapee River, Kewaunee River and Red River and Sturgeon Bay) contributing to one basin which feeds the Lake Michigan drainage area.

- Lakeshore Basin: This basin completely encompasses the counties of Door, Kewaunee and Manitowoc; and parts of Brown and Calumet counties. It is a water-rich area sprinkled with an assortment of inland lakes, major rivers and small streams and bounded by the waters of Green Bay and Lake Michigan. The area was sculpted by glaciers and is dominated by the Niagara limestone formation, which underlies most of the basin, but projects above ground prominently as the Niagara Escarpment, visible throughout much of Door County. Tourism, manufacturing and agriculture dominate the economy. The basin's blend of picturesque open land and abundant water combined with seemingly limitless recreational opportunities are increasingly in demand. However, the close proximity of this area to large urban centers is putting enormous stress on natural resources. The challenge for all of us is to satisfy people's needs without destroying the abundant but fragile natural resources that make the basin so attractive to so many people.³⁰

Soil Types

The soil of Kewaunee County (see Appendix A: Maps) is similar to that found throughout Wisconsin. Many of the soils of Wisconsin are young soils: entisols and inceptisols. Mature soils include mollisols, alfisols and spodosols. Histosols occur in wetland areas. Soils denoted with the suffix "p" are most likely to include mollisols

²⁹ http://dnr.wi.gov/topic/SurfaceWater/oerw/orwerw_county.pdf

³⁰ <https://dnr.wi.gov/topic/watersheds/basins/lakeshore/>

and soil group J includes most of the histosols. Alfisols dominate in areas originally covered by deciduous forest, spodosols in coniferous areas. Steep slopes are more likely to consist of less-developed soils since erosion strips away material nearly as fast as soil can develop.

Kewaunee County's primarily clay loam soils are well suited for growing a variety of crops including corn, alfalfa, soybeans, small grains and vegetables. In Kewaunee County, farmers face the challenge of making a living from the land, while protecting the natural resources through sound farming practices. Proper management of agricultural lands to control erosion, remove excess water, minimize pollution and provide a good economic return is necessary for the Kewaunee County agriculture industry to remain strong.

A Kewaunee County soil survey, the "Soil Survey of Kewaunee County, Wisconsin,"³¹ was prepared by the Natural Resources Conservation Service³² and can provide very specific details on the county's soil types. The county's *Land and Resource Management Plan 2010-2019* lists the following eight soil mapping units:

- Hortonville-Symco, 34.8%
- Kewaunee-Manawa, 18%
- Casco-Boyer, 13%
- Waymor-Lamartine-Pella, 11%
- Onaway-Solona-Hortonville, 10%
- Carbondale-Cathro-Markey, 7%
- Kolberg-Namur-Longrie, 6%
- Wainola-Oakville, 0.2%

Wetlands

According to the Wisconsin Department of Natural Resources, Kewaunee County has approximately 27,436 acres of wetlands (approximately 12.5% of its total area). This is 0.5% of the total statewide acreage of wetlands.³³

From the sedge meadows of southern Wisconsin to the spruce bogs in the north, wetlands cover a wide array of landscapes. They share in common the ability to support aquatic or "water loving"

³¹ Soil Survey of Kewaunee County, 1980
https://www.nrcs.usda.gov/Internet/FSE_MANUSCRIPTS/wisconsin/kewauneeWI1980/kewauneeWI1980.pdf

³² <http://websoilsurvey.nrcs.usda.gov/app/>

³³ <http://www.dnr.state.wi.us/org/water/fhp/wetlands/acreage.shtml>

plants, and provide habitat for more species of plants and animals than any other type of landscape in Wisconsin. Habitat is not their only functional value. Wetlands can also store water to prevent flooding, purify water, protect lake and stream shores from eroding and provide recreational opportunities for wildlife watchers, anglers, hunters and boaters.³⁴

Because wetlands provide many benefits to the environment, several municipal, state and federal ordinances/regulations protect wetland areas. The basic concept associated with these laws is that wetland areas on any property cannot be disturbed without a permit. Wetlands store flood waters and filter water from precipitation before it enters lakes and streams. Some wetlands also recharge local groundwater aquifers. By slowing water movement, wetlands reduce the likelihood that heavy rainfall or spring snowmelt will cause erosion and flooding. Wetlands retain eroded soil and hold nutrients that would otherwise promote excessive weed growth and algae blooms in lakes and streams. These nutrients, when held in the wetlands, produce a heavy growth of vegetation that provides nesting sites, food and cover for waterfowl, small mammals and many other types of wildlife. Wetlands also provide recreational opportunities for humans (wildlife observation, hiking, hunting, etc.)

There are three basic factors in determining whether or not a property is a wetland:

- The presence of water at, near or above the surface (hydrology).
- Water present long enough to sustain aquatic plant life (hydrophytic vegetation).
- Soils indicative of wet conditions (hydric soils).

Figuring out what is or is not a wetland can be extremely confusing if you only associate “wetlands” with the presence of water. It is possible that a property could have standing water for a portion of the year and still not be a wetland and it is also possible that a true wetland with all three of the above characteristics may never have water present above the land surface.

Wetlands perform an important set of natural functions, which make them particularly valuable resources lending to overall environmental health and diversity. Some wetlands provide seasonal groundwater recharge or discharge. Those wetlands that

³⁴ <http://dnr.wi.gov/wetlands>

provide groundwater discharge often provide base flow to surface waters. Wetlands contribute to the maintenance of good water quality, except during unusual periods of high runoff following prolonged drought by serving as traps, which retain nutrients and sediments, thereby preventing them from reaching streams and lakes. They act to retain water during dry periods and hold it during flooding events, thus keeping the water table high and relatively stable. They provide essential breeding, nesting, resting, and feeding grounds and predator escape cover for many forms of fish and wildlife. These attributes have the net effect of improving general environmental health; providing recreational, research and educational opportunities; maintaining opportunities for hunting and fishing and adding to the aesthetics of an area.

Wetlands pose severe limitations for urban development. In general, these limitations are related to the high-water table and the high compressibility and instability, low bearing capacity and high shrink-swell potential of wetland soils. These limitations may result in flooding, wet basements, unstable foundations, failing pavements and failing sewer and water lines. Moreover, there are significant and costly onsite preparation and maintenance costs associated with the development of wetland soils, particularly in connection with roads, foundations and public utilities.

There are two main levels of jurisdiction (often overlapping) concerning wetlands in Kewaunee County are the Wisconsin Department of Natural Resources and municipal zoning agencies. The Land and Water Conservation Department has jurisdiction over wetlands in county zoning plans while wetlands within city or village boundaries are also subject to the appropriate municipality's regulations.

Land Use

Land use in Kewaunee County is mixed and can be summarized as follows: ³⁵

- Agricultural Land 168,902 acres (76.7%)
- Barren Land 1,421 acres (>1%)
- Forested Wetland 17,373 acres (7.9%)
- Grassland 7,502 acres (3.4%)

³⁵ www.co.kewaunee.wi.gov/docview.asp?docid=15450&locid=192

- Urban Areas 1,524 acres (>1%)
- Wetland Vegetation 9,519 acres (4.3%)
- Wooded Areas 13,994 acres (6.4%)

Outside of the cities of Algoma and Kewaunee land is primarily used for farming. Dairy farming is the leading agricultural endeavor with the main crops including alfalfa, corn, soybeans, oats and winter wheat. Within the cities, manufacturing; health care, education and social services; retail services and construction are currently leading industries and are projected to continue to grow.

Vegetation

Vegetation throughout the region is made up of areas of mostly maple, hemlock and yellow birch. The north-central portion of the county contains an area of conifer swamp.³⁶

³⁶ <http://www.wisconline.com/counties/kewaunee/index.html>

Demographics

Human Settlement Patterns

Kewaunee County's rich history dates all the way back to the seventeenth century and the famous French explorer, Jean Nicolet. When he visited in 1634, it was the site of a large Potowotami village. Forty years later, on November 1, 1674, Father Jacques Marquette celebrated the Holy Sacrifice of Mass in what is now Kewaunee. The event is commemorated with an historical marker.

More than a hundred years later, in 1795, Jacques Veau, a French trader, established a trading post at the mouth of the Kewaunee River. The first permanent European settlement began in 1836, when rumors of gold having been found near the mouth of the Kewaunee River led to "gold fever". Preparations were made to lay out a city which was confidently expected to rival Chicago in importance.

Joshua Hathaway, a prosperous land developer, purchased lots in Kewaunee, and was commissioned by the district surveyor to lay out the town. He arranged the area in wide avenues averaging 75 feet, with 50x150 foot lots. Lots started selling that fall, but when the gold boom turned bust, the land speculators moved on.

In 1837, the Chicago firm of Montgomery & Patterson built a mill on the Kewaunee River about three miles from the outlet. The mill was abandoned soon after and reverted to Joshua Hathaway, the original owner, who sold it in 1843 to John Volk of Illinois. In 1850-51, a pier was built into Lake Michigan, and Volk began to expand, building a water mill on the river and a steam mill on the lake.

Kewaunee County was separated from Door County on April 16, 1852 and organized independently the following November. Settlement began in earnest around the same time, as land sales were opened up and Yankees flocked to the area from the East Coast. They were followed by a large influx of European immigrants, including many Bohemians. Kewaunee was incorporated as a Village in 1873, and became a City twenty years later. Kewaunee's natural harbor was a major factor in the development of the early settlement.

The first recorded visit by a sailing craft was the schooner Rochester in 1847. In the summer of 1856, the side wheel steamer Cleveland began making regular trips along the west shore as far as Green Bay, stopping at Kewaunee. In 1859, a second pier was constructed to accommodate the rapidly growing schooner and steamer traffic, which served both commercial and passenger uses. In 1859, the citizens called several meetings to make plans for developing the harbor, but the Civil War intervened, and work on the present-day harbor was not begun until 1881.

In 1891, the City of Kewaunee was one of the great marine ports of the northern lakes. Rail service came to Kewaunee in 1891, with the building of the Kewaunee, Green Bay and Western Railroad. Kewaunee's transportation links were further enhanced in 1892, when the first car ferry service across Lake Michigan was instituted between Kewaunee and Frankfort, Michigan.

During the late nineteenth and early twentieth centuries, The City of Kewaunee was a prosperous community with a thriving economy, based at first on its proximity to Wisconsin's northern forest and excellent transportation connection, and later on its diverse retail and manufacturing base.³⁷

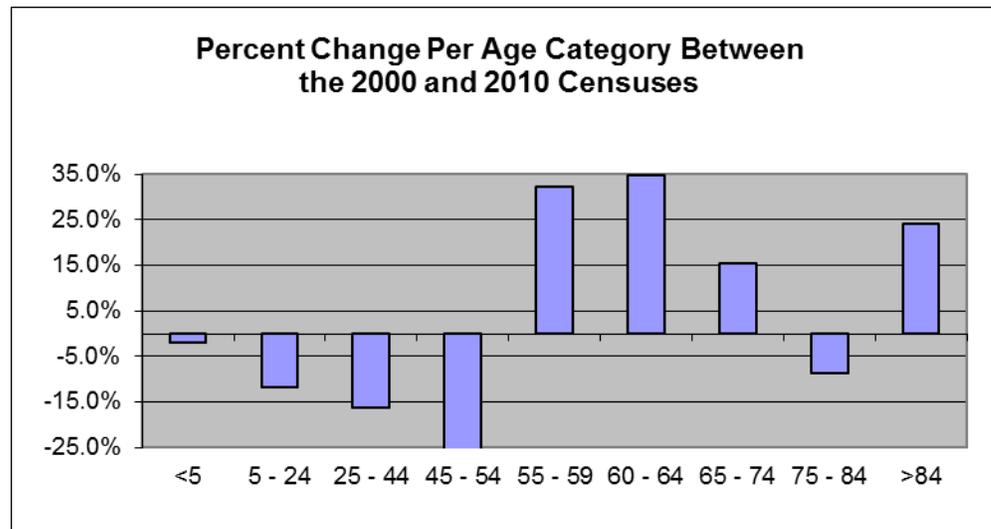

Population

In recent decades, the Kewaunee County population has declined slightly. In the 2010 U.S. Census, the county was home to 20,574 people and according to the 1 July 2017 U.S. Census Bureau estimate³⁸, there were 20,445 people residing in Kewaunee County for a loss of 0.6%.

According to the 2012-2016 U.S. census estimate, there were 8,211 households in Kewaunee County with an average of 2.47 people per household. The 2012-2016 U.S. census numbers indicate that the median household income was \$58,152 and that the per capita income is \$27,539. Approximately 7.6% of the people live below the poverty line. The 2017 census estimate also indicated that there were approximately 9,436 housing units within the county as of 1 July.

³⁷ <https://www.kewaunee.org/kewaunee-s-history>

³⁸ <https://www.census.gov/quickfacts/fact/dashboard/kewauneecountywisconsin,US/PST120217>

According to the 2010 U.S. Census, the overwhelming majority of people in Kewaunee County reported that they were white. People of Hispanic or Latino origin were counted either as a subcategory of those reporting that they were white, as another race or as two or more races. Hispanic/Latino individuals totaled 2.3% of those three categories. There are no Native American tribal lands located within Kewaunee County.

Other miscellaneous demographic information reported by the census bureau is detailed below. These figures identify potential needs for special consideration in a disaster response or in recovery operation planning and implementation.

- People under 5 years old: 5.0%
- People under 18 years old: 21.7%
- People over 65 years old: 19.9%
- Females: 49.3%
- Foreign born: 1.9%
- People with a disability, under 65 years old: 8.2%

The county contains the Cities of Algoma and Kewaunee and the Villages of Casco and Luxemburg. There are also 10 towns including Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Pierce, Red River and West Kewaunee.

Transportation Network

Kewaunee County has a good transportation network with state highways connecting the population centers. To help for current

and future traffic conditions, it is useful to categorize roads based on their primary function. Arterials accommodate the efficient movement of vehicles, while local streets provide the land access function. Collectors serve both local and through traffic by providing a connection between arterials and local roads. The map in Appendix A shows the various roads in the county:³⁹

Interstate Highways

- None

Principal Arterial

- State Highway 29
- State Highway 42
- State Highway 54
- State Highway 57

This street and highway system within the county serves several important functions; including providing movement of vehicular traffic; providing access for vehicular traffic to abutting land uses; providing for the movement of pedestrians and bicycles and serving as a location for utilities and storm water drainage facilities.

The county and municipal governments of Kewaunee County maintained these roads to provide a safe and efficient transportation system. With continued maintenance, these roads will continue to serve the population effectively.

Land Use and Development Trends

Kewaunee County is primarily a mixed-use community and has some natural areas that will not be developed and some rural farming areas. The county was experiencing slow growth on par with other demographically similar Wisconsin counties until the economic “Great Recession” that began in 2008, which halted growth and actually constricted the community activity in some areas. Since then, recovery and growth trends have mirrored the recovery of the general national, state and regional economy.

Current land use is variable and includes residential, commercial, industrial, agricultural, wetlands, woodlands and unused rural/open lands. The Wisconsin Department of Revenue (WDOR) tax

³⁹ <https://wisconsin.gov/Documents/travel/road/hwy-maps/county-maps/kewaunee.pdf>

assessment data classifies the land use in Kewaunee County as follows: ⁴⁰

- *Agricultural (Includes WDOR categories of Forest, Agricultural Forest and Other)* - Lands devoted primarily to agriculture, small-scale agricultural forestation and lands that are producing, or are capable of producing, commercial forest products (as defined by State of Wisconsin Statute 70.05) and other supporting activities. Also includes lands containing dwelling units and related improvements associated with agricultural use. This category does not include forests or woods that are in parks or that are not being forested under WDOR definitions.
- *Residential* - Lands containing dwelling units and related improvements not associated with agricultural use.
- *Commercial* - Lands, including improvements, devoted primarily to commercial operations, including, but not limited to dining, lodging, and retail sales establishments.
- *Manufacturing* - Lands, including improvements, devoted primarily to manufacturing and industrial operations, including, but not limited to, assembling, processing, and fabricating.
- *Undeveloped* - Lands generally unfit for any of the aforementioned uses, including, but not limited to, parks, hunting grounds, wetlands, ponds, gravel pits, and road rights of way.

**Land Uses Changes Based on 2017 WDOR
Kewaunee County Tax Assessment Data⁴¹**

Land Use Category	2016 Equalized Value	2017 Equalized Value	Percent Change
Agricultural	\$25,040,300	\$25,414,900	1%
Agricultural Forest	\$33,631,500	\$33,645,100	0%
Forest	\$33,423,200	\$33,464,900	0%
Residential	\$1,072,233,900	\$1,142,007,400	7%
Commercial	\$362,437,100	\$144,833,300	-60%

⁴⁰ <https://www.revenue.wi.gov/SLFReportsassessor/2017socKEWf.pdf>

⁴¹ <https://www.revenue.wi.gov/Pages/EQU/2017-expeqv.aspx>

Manufacturing	\$39,766,100	\$40,278,600	1%
Undeveloped	\$26,083,100	\$25,832,700	-1%
Other	\$185,491,500	\$190,501,300	3%
Total	\$1,778,106,700	\$1,635,978,200	-8%

Development trends in Kewaunee County mirror that of Wisconsin in general. The footprints of the cities and villages are expanding to redevelop more of the surrounding agricultural and undeveloped areas into suburban housing. The still considerable amount of rural agricultural area not being developed is slowly altering from small, family farms to larger, and sometimes corporate, concerns.

Kewaunee County is committed to planning appropriate growth and the elected officials monitor on-going development. To that end, the following projects were identified for future development within the county:

Kewaunee County

- Construct a mile of road (CTH AB) from the Door County line south to Duvall.

Village of Casco

- CTH C upgraded and re-blacktopped
- Repair damaged curbs, gutters and sewer

Public Safety Support

The Kewaunee County Communications Center is a 9-1-1 Public Safety Answering Point (PSAP) and Dispatch Center for Kewaunee County. The communications center is staffed with one supervising lieutenant and 13 uniformed deputies that serve on alternating days as 9-1-1 dispatchers and jail officers.

The departments listed below provide ongoing training to their staff and participate in periodically scheduled disaster exercises with area hospitals, other emergency medical services, law enforcement, fire services and emergency management.

Medical

The Kewaunee County Office of Emergency Management, city and county emergency services responders, hospital emergency staff and various departments have developed medical and mass casualty plans. These plans will be used in the event of a disaster. There are no hospitals within Kewaunee County; most people receive care from the hospitals in Brown, Door or Manitowoc Counties. These hospitals will coordinate with responding agencies to ensure the best utilization of services and the least injury or loss of life from a disaster situation. It should also be noted that area hospitals have reciprocal verbal agreements for transferring critical patients during a disaster.

Kewaunee County relies wholly on volunteer staff for pre-hospital emergency medical services. (See County First Responder Districts Map in Appendix A for district boundary details.) Pre-hospital medical units⁴² and their staffing are listed below:

- **Algoma Fire and Rescue** - License Level: Advanced Emergency Medical Technician
- **Carlton First Responders** - License Level: Emergency Medical Responder
- **Casco Lincoln First Responders** - License Level: Emergency Medical Responder
- **Franklin First Responders** - License Level: Emergency Medical Responder
- **Kewaunee Area Ambulance Service** - License Level: Advanced Emergency Medical Technician
- **Luxemburg Emergency and Rescue Association** - License Level: Advanced Emergency Medical Technician
- **Montpelier First Responders** - License Level: Emergency Medical Responder
- **West Kewaunee First Responders** - License Level: Emergency Medical Responder

Each of these departments provides monthly training to their staff and Kewaunee County Emergency Management participates in disaster exercises with area hospitals at least once per year as required by the Radiological Emergency Preparedness (REP)

⁴² <https://www.dhs.wisconsin.gov/ems/provider/kewaunee.htm>

program. County emergency medical technicians, ambulances, police, county sheriff's deputies and volunteers participate in these and other periodically scheduled exercises.

Fire Service

Kewaunee County is served by the following fire departments:⁴³

- Algoma Fire Department
- Carlton Town Volunteer Fire Department
- Casco Volunteer Fire Department
- Kewaunee Volunteer Fire Department
- Luxemburg Volunteer Fire Department

Refer to Appendix A for a map of the fire districts in Kewaunee County.

Law Enforcement

Several departments in Kewaunee County are responsible for law enforcement duties within the county. The Cities of Algoma and Kewaunee and the Village of Luxemburg have full-time law enforcement officers. The Kewaunee County Sheriff's Department provides 12 uniformed patrol deputies, with one supervising lieutenant, for the rest of the county. Also, the Wisconsin State Patrol provides limited coverage from their region office in Fond du Lac.⁴⁴

Special Teams

Hazardous materials (HazMat) response is performed by Type II and Type III Teams in the Northeast Task Force.⁴⁵ Wisconsin Emergency Management contracts and manages twenty-one Regional Hazardous Materials Response Teams. The teams are divided into Task Forces: Northeast Task Force, Northwest Task Force, Southeast Task Force and the Southwest Task Force. These Task Forces are then divided into Type I, Type II and Type

⁴³ <https://www.firedepartment.net/directory/wisconsin/kewaunee-county>

⁴⁴ <http://wisconsin.gov/Documents/about-wisconsin/who-we-are/dsp/dsp-regions-map.pdf>

⁴⁵ https://dma.wi.gov/DMA/divisions/wem/response/images/HazMat_Type_Teams.pdf

Demographics

III teams, all with complimentary capabilities and training requirements.

The Wisconsin Hazardous Materials Response System may be activated for an incident involving a hazardous materials spill, leak, explosion, injury or the potential of immediate threat to life, the environment, or property. The Wisconsin Hazardous Materials Response system responds to the most serious of spills and releases requiring the highest level of skin and respiratory protective gear. This includes all chemical, biological, or radiological emergencies.

Local (County) Hazardous Materials Response Teams respond to chemical incidents which require a lower level of protective gear but still exceed the capabilities of standard fire departments. Thirty-eight counties currently have level 4 Hazardous Materials Response Teams. Those teams may provide assistance to surrounding counties and are approved by the Local Emergency Planning Committees.⁴⁶

Archaeological and Historical Resources

The National Register of Historic Places also includes a listing of locations in Kewaunee County.⁴⁷ As mitigation projects are considered, the county is committed to ensuring that archaeological and historical sites are preserved.

Historic Sites ⁴⁸		
Historic Site Name	Address	Municipality
Ahnapee Brewery	115 Navarino Street	Algoma
America Shipwreck (Canaller)	4 miles offshore in Lake Michigan	Carlton
Art Dettman Fishing Shanty	Church Street at the Ahnapee River	Algoma
Daniel Lyons Shipwreck	East of Stoney Creek, Lake Michigan	Algoma
George Halada Farmstead	E-1113 County Trunk Highway F	Montpelier

⁴⁶ https://dma.wi.gov/DMA/divisions/wem/response/images/HazMat_County_Teams.pdf

⁴⁷ <https://nationalregisterofhistoricplaces.com/wi/kewaunee/state.html>

⁴⁸ <http://www.wisconsinhistory.org/hp/register/>

Historic Sites⁴⁸		
Historic Site Name	Address	Municipality
Kewaunee County Sheriff's House and Jail	Court House Square, junction of Dodge and Vliet Streets	Kewaunee
Kewaunee Post Office	119 Ellis Street	Kewaunee
Major Wilbur Fr. Browder (tugboat)	Harbor Park, Kilbourn Street	Kewaunee
Marquette Historic District	Roughly bounded by Lake Michigan and Center, Juneau and Lincoln streets	Kewaunee
Massart Farmstead	North of Casco on County Road C	Casco
Melvin W. & Mary Perry House	519 Third Street	Algoma
Pilgrim Family Farmstead	SW of Kewaunee on Church Road	West Kewaunee
St. Lawrence Catholic Church	Junction of County Road AB and County Highway J	Franklin

The Wisconsin Historical Society maintains a list of archaeological sites and cemeteries known as the Archaeological Site Inventory Database (ASI); this list is available to governmental agencies upon request. These sites cover an extended period of time, and include campsites/villages/communities, cabins/homesteads, sugar maple sites, cemetery/burial/ mounds, trading/fur posts, mill/sawmills and kilns.

All of these sites have been reported to the State Historical Society of Wisconsin and are protected sites. If there is concern that a mitigation project will impact one of these or any other identified or suspected archeological site, the county will work with the proper authorities to ensure that all applicable laws and regulations are followed

Hazard Analysis and Previous Mitigation Projects

The following sections identify those hazards that have occurred or could occur in Kewaunee County. Each includes a description of a hazard and its frequency of occurrence. Also included is a section that describes the general vulnerabilities of the community and its infrastructure to each particular type of hazard. More detailed and specific analyses will be conducted as projects are identified for inclusion in grant applications. As part of the application process, the methodology of data collection and future development patterns will be addressed. Estimates of potential dollar losses and the methodology used to arrive at those estimates will also be described during this application process.

Wisconsin Emergency Management (WEM) completed and regularly updates the State Hazard Mitigation Plan, which was last revised in October, 2016. This plan describes the hazards that have occurred or are most likely to occur within the state and includes the frequency of occurrence, potential impacts and suggested actions to mitigate the hazard. This plan is the basis for the development of all emergency management plans and is distributed upon revision to county emergency government directors and other stakeholder agencies.

The Kewaunee County Emergency Management Director develops and annually updates a listing of all hazards that have occurred or could occur within the county. This listing includes the definition, frequency of occurrence and actions to mitigate the hazard. In general, the threat of most hazards is consistent throughout the county. The only hazard where there were differences identified within the county was for flooding and for that hazard, specific locations are identified.

For this plan the Kewaunee County Hazard Mitigation Plan Workgroup reviewed the past events records and an internal workgroup consensus was reached on the anticipated probability of future events. This probability was designated as “very high,” “high,” “medium,” “low” or “very low” by the workgroup based on their evaluation and experience with the data, the table of those rankings follows:

Hazard Analysis and Previous Mitigation Projects

Hazard	Likelihood of Occurrence*	Severity of Effects if It Does Happen*	Misc. Notes
Coastal Erosion	Medium	Low	
Drought/Dust Storm	Low	General Population: Low Agriculture: High	
Earthquake	Very Low	Low	
Flood – Flash Flood & River Flood	Low Flash Flood	Very Low	
	Medium River Flood	Medium River Flood	Kewaunee River high in 2019
Flood – Dam Break	Very Low	Low	1 dam in county maintained
Fog	High	Low	
Forest Fire	Very Low	Very Low	Patchy woods – no forest
Wildfire	Low	Low	
Landslide	Very Low	Very Low	Flat
Karst	High	Well Water: High	Largely affected
Severe Temperature (Hot)	Medium	Medium	
Severe Temperature (Cold)	Medium	Medium	
Hail	High	Crops, roof, comm tower, cars: High Other: Low	Tower
Lightning	High	Low	
Thunderstorm	High	Low	
Tornado	Low	High	
Derecho (High Wind)	Low	High	
Winter Storm (Snow & Ice)	High	Medium	Heavy snow impact
Utility Failure	Low	High	

The emphasis in the following sections is on mitigation activities for each hazard as a major component of overall emergency management. Mitigation or prevention activities reduce the degree of long-term risk to human life and property from natural and man-made hazards. The cooperation of government, academia, the private sector and volunteer agencies is essential in mitigation efforts. The Kewaunee County Emergency Management Office is committed to working with municipalities and the private sector to ensure that county mitigation information is shared and it is incorporated into their planning as appropriate. It is important to note that while Kewaunee County is committed to hazard mitigation, an assessment of the risk of natural disasters is considered overall generally low. This assessment is reflected in the lack of historical disasters plus a review of geographic, meteorological and other conditions reduces the county's ability to have many hazard mitigation strategies that meet a cost-benefit analysis county-wide as well as within the municipalities.

Each community will be given a copy of the plan to use as a reference during their own preparedness activities (i.e., planning, training, permitting, zoning.) Communities that have their own comprehensive plan will reference this mitigation plan and its contents in the next scheduled plan update during public meetings, workgroup sessions and as texts are written. Municipalities that do not have comprehensive plans either are under the purview of and request assistance from Kewaunee County or have their own planning departments. Members of the County Land Information Office and Land and Water Conservation Department and municipal planning departments were included on the Hazard Mitigation Workgroup and are aware of the benefits and requirements to using this plan as they go about their preparedness activities. At this time, general themes and ideas from the previous mitigation plan were included as the county and municipalities discussed the updates of the applicable coordinating plans (e.g., comprehensive, flood, storm water) but there are no direct examples of text or specific ideas that can be listed as having come from the hazard mitigation plan.

Kewaunee County and its municipalities have an interest in identifying, planning and completing hazard mitigation projects including these (listed below), which received supplemental funding. It was also noted by the workgroup that there are several opportunities for grant funding from various federal and state resources including:

Community Development Block Grant (CDBG) - The U.S. Department of Housing and Urban Development (HUD) Community Development Block Grant-Disaster Recovery Assistance provides flexible grants to help cities, counties and states recover from Presidentially-declared disasters, especially in low-income areas, subject to availability of supplemental appropriations. In response to disasters, Congress may appropriate additional funding for the CDBG program as disaster recovery grants to rebuild the affected areas and provide crucial seed money to start the recovery process. Since CDBG Disaster Recovery assistance may fund a broad range of recovery activities, HUD can help communities and neighborhoods that otherwise might not recover due to limited resources. Disaster Recovery grants often supplement the disaster programs of FEMA, the SBA and the U.S. Army Corps of Engineers (i.e., these funds can be used for the local matching requirement of other federal grants).⁴⁹ Kewaunee County does not have any current EAP projects.

It was noted by the workgroup that there are several opportunities for grant funding from various federal and state resources including:

- **HMGP** - The Hazard Mitigation Grant Program (HMGP) is authorized by Section 404 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act, as amended. The key purpose of HMGP is to ensure that the opportunity to take critical mitigation measures to reduce the risk of loss of life and property from future disasters is not lost during the reconstruction process following a disaster. HMGP is available, when authorized under the Presidential major disaster declaration, in the areas of the state requested by the governor.⁵⁰
- **PDM** - The Pre-Disaster Mitigation (PDM) program is authorized by Section 203 of the Stafford Act, 42 U.S.C. 5133. The PDM program is designed to assist States, Territories, Indian Tribal governments, and local communities to implement a sustained pre-disaster natural hazard mitigation program to reduce overall risk to the population and structures from future hazard events, while also reducing reliance on Federal funding from future major disaster declarations.⁵¹

⁴⁹ http://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/communitydevelopment/programs/drsi

⁵⁰ <http://www.fema.gov/hazard-mitigation-grant-program>

⁵¹ <http://www.fema.gov/pre-disaster-mitigation-grant-program>

Pre-Disaster Mitigation (PDM) Projects and/or Plans Funded in Kewaunee County⁵²

- 2003C Kewaunee County (\$36,000) – New Plan is approved
 - 2007C (\$402,574) – Update agreement with UW for HAZUS flood risk assessment
 - 2010C Kewaunee County (\$23,038)-Update in planning process
-
- **FMA** - The Flood Mitigation Assistance (FMA) program is authorized by Section 1366 of the National Flood Insurance Act of 1968, as amended with the goal of reducing or eliminating claims under the National Flood Insurance Program (NFIP). The Repetitive Flood Claims (RFC) program has the goal of reducing flood damages to individual properties for which one or more claim payments for losses have been made under flood insurance coverage and that will result in the greatest savings to the National Flood Insurance Fund (NFIF) in the shortest period of time.⁵³
 - **406 Mitigation** – The Public Assistance-Section 406 Mitigation Funding may be considered by FEMA in a federal disaster declaration to fund mitigation measures to a public facility damaged by the event that enhance the facility's ability to resist similar damage in future events. This funding is authorized under Section 406 of The Robert T. Stafford Disaster Relief and Emergency Assistance Act and provides discretionary authority to fund mitigation measures in conjunction with the repair of the disaster-damaged facilities, which usually present themselves during the repair efforts. The mitigation measures must be related to eligible disaster-related damages and must directly reduce the potential for future, similar disaster damages to the eligible facility. This work is performed on the parts of the facility that were actually damaged by the disaster and the mitigation provides protection from subsequent events. Mitigation measures must be determined to be cost-effective, technically feasible, and in compliance with statutory, regulatory and executive order requirements. In addition, the measure cannot

⁵² Note that several grants to the State of Wisconsin/WEM are listed when searching for Kewaunee County projects. These state projects are deemed as benefiting the state's counties but are not listed in this plan because they were not directly received by the county.

⁵³ <http://www.fema.gov/flood-mitigation-assistance-program>

cause a negative impact to the facility's operation, surrounding areas, or susceptibility to damage from another hazard.⁵⁴

- **Municipal Flood Control Grant Program** - This Wisconsin Department of Natural Resources (DNR) grant is available to all cities, villages, towns, tribes and metropolitan sewerage districts. Assistance is provided with items such as the acquisition of property, vacant land, structure removal, flood proofing, administrative support and others.⁵⁵
- **Dam Removal Grant Program** - This Wisconsin DNR grant is available to all cities, villages, towns, tribes and metropolitan sewerage districts and provides 100% of eligible project costs up to a maximum of \$50,000 to remove a dam. Assistance is provided with items such as: the acquisition of property, vacant land, structure removal, flood-proofing, administrative support and others.⁵⁶

⁵⁶ <http://dnr.wi.gov/aid/damremoval.html>

All Hazards

One of the bedrock principles of emergency management is to approach issues from an all-hazards perspective. This is generally very cost effective because it accomplishes preparedness and/or mitigation goals for many types of disasters with one resource. Some of the all hazards mitigation projects that Kewaunee County would like to accomplish are detailed in the following sections.

The planning committee also used the all hazards approach to identify mitigation goals for the county and all of its municipalities. The purpose hazard mitigation plan is to identify hazard areas, to assess the risks, to analyze the potential for mitigation and to recommend mitigation strategies where appropriate. Potential mitigation projects will be reviewed using criteria that stress the intrinsic value of the increased safety for people and property in relation to the monetary costs to achieve this (i.e., a cost-benefit analysis). With that in mind, the planning goals for this entire plan, as determined by the mitigation planning committee were:

- **Objective 1:** To preserve life and minimize the potential for injuries or death.
- **Objective 2:** To preserve and enhance the quality of life throughout Kewaunee County by identifying potential property damage risks and recommending appropriate mitigation strategies to minimize potential property damage.
- **Objective 3:** To promote countywide planning that avoids transferring the risk from one community to an adjacent community, where appropriate.
- **Objective 4:** To identify potential funding sources for mitigation projects and form the basis for FEMA project grant applications.

Vulnerability

Perhaps the largest risk that falls under the all-hazards banner is the continuing challenge of securing funding to keep up with the rapid technological changes and advances in the public safety communications infrastructure. When departments cannot communicate with each other, they cannot be effectively coordinated in a disaster which could cause potential delays in providing critical services to citizens in need.

Another vulnerability is the fact that not all agencies that work together in disaster response and recovery can communicate with one another (i.e., are interoperable). Local first response agencies are generally able to communicate with one another but communications-related issues will remain ongoing challenges as technologies evolve and departments acquire equipment suitable for their response.

The first concern is having an open channel with the public both on an on-going and on an emergency basis. Good communications are critical to give the members of the public the time to prepare themselves for disaster ahead of time. Messages of this nature might include hazardous weather safety information, floodplain information, etc. It is also critical for citizens to receive accurate and timely information during and after a disaster. As technologies have improved, there is a need to ensure that the county employs the technologies that are:

- Most commonly used by the public (e.g., internet, cellular telephones, television media),
- Available during a disaster (e.g., cellular phones may be overloaded, electrical power for televisions might not be available),
- Redundant so that if one system is out, others may be available,
- Integrated so that all of the communications technologies can work together in an overall communications strategy and
- As cost-efficient as possible.

Hazard Mitigation Strategies

In general, most of the projects that can be done with current budgetary dollars are not capital improvement projects and are not very expensive. Projects that require significant capital outlays are, for the most part, grant-dependent. Since the profile (e.g., economic, geographic) of an area may change between the identification of a project in this plan and the availability of grant funds, projects will be identified within the plan and be slated for detailed study and analysis at such time as grants become available. The detailed study will identify the types and numbers of existing and future structures, the potential dollar losses to vulnerable structures and the lead agency or department who will manage the project. At that time, grant-eligible projects will be evaluated using the appropriate grant criteria for factors such as:

- Overall benefit to the community
- Economic feasibility (i.e., a cost-benefit analysis)
- Compliance with environmental, social justice and other laws

Most of the hazard mitigation strategies listed below are not “bricks and mortar” changes. Rather, they are enhancements to computer and radio equipment and plans that allow better communication with the public in times of crisis and therefore do not reduce effects for existing or future buildings and infrastructure.

Warning and Communication Plans

Warning and communication plans are vital in a time of crisis to reduce property damage and human casualties. An advance plan allows the appropriate authorities to perform their emergency duties in an efficient manner.

Kewaunee County will maintain the following:

- Facilities, systems and procedures to activate warning and communication capabilities,
- Systems to support communications, including:
 - Telephone and radio to notify public personnel
 - Local television, radio and newspaper to spread warning information
 - Local law enforcement and fire and rescue communications
 - An emergency communications center,
- Kewaunee County Sheriff’s Office dispatch staff to receive and distribute warning information to the public and emergency management agencies.

During an emergency, the general public receives information by sirens, NOAA weather radio, local broadcast or printed media, door-to-door notification by emergency services personnel and/or a mobile public address system. It should be noted that the ability to use the NOAA weather radio system for an expanded list of emergency messages is a positive move that makes this alert and

warning tool even more valuable. As a result, Kewaunee County will continue to promote increased use of these radios among the public.

Methods for notification of the functional and access needs populations include door-to-door warnings, foreign language media messages and closed-caption television messages. Other notices and procedures can be found in Kewaunee County's Emergency Operations Plan which is reviewed and updated on a regular schedule.

Kewaunee County should be capable of the following:

- Disseminating emergency warning and notification to the public through its county-wide warning systems;
- Supporting emergency management operations;
- Providing adequate warning and communication systems;
- Planning for alternative means and resources in the event of a warning or communication system breakdown.

Kewaunee County will prepare facilities, systems and procedures to activate warning and communication. During an emergency, Kewaunee County will deliver prompt and accurate warnings to businesses and residents. The county budget to maintain warning and communication systems has thus far been sufficient but there are several expensive projects on the horizon that are a source of concern for the community. The county would like to complete several enhancement projects include the following:

- The County Emergency Management Department would like to equip all of the special facilities in the county with National Oceanic and Atmospheric Administration (NOAA) weather radios. These radios would relay messages regarding traditional weather concerns such as tornados and thunderstorms. NOAA also has alerted emergency management officials that other types of emergency messages such as terrorism alerts and missing children notifications can be released via their system. This enhanced capability makes these radios an excellent tool for initial alert and notification to staff in these special facilities. This project is a high priority and the estimated cost, which will have to be secured through grants, will be \$400,000.

The county emergency management office will also work to encourage all households to purchase a weather radio.

- Purchased 200 radios (80 left). CBRFs and nursing homes received radios with assistance from Public Health.
 - Campaign in spring to encourage NOAA radio use. Suggest radios as Christmas gifts on Facebook. Advertise via Facebook and Code Red (reverse 911).
 - Going forward with assistance from Sheriff's Office; Algoma, Luxemburg and Kewaunee Police Departments.
- The Kewaunee County public safety communications equipment, like all technology, must continually be upgraded and expanded to meet the increasing needs for multi-modal communications. The Sheriff's Office, with the support of Emergency Management and the municipal first response agencies, will continue to evaluate and plan for system upgrades and expansions, as needed.

Website

Kewaunee County has a general web site⁵⁷ with links to various departmental/agency pages. The hazard mitigation workgroup identified a need to have a repository for emergency preparedness information for individuals and families and decided that the Emergency Management Department should host this information. The department has a general page⁵⁸ hosted by the county but much of their information and interaction with the public is via the Facebook page⁵⁹. The department can link to agencies such as Wisconsin Emergency Management, the Federal Emergency Management Agency, American Red Cross and NOAA. The county also can include fact sheets and emergency prepared information on some hazards. In recognition of the importance of the internet as a communication tool, especially in pre-planning activities, the Emergency Management Department will review their web pages on a regular schedule to ensure that important information and links for general preparedness topics are available. The county would like to be able to use the internet communications to relay emergency information.

⁵⁷ <http://www.kewauneeco.org/>

⁵⁸ <https://kewauneeco.ags.ruekert-mielke.com/>

⁵⁹ <https://www.facebook.com/KewCoEM>

Kewaunee County also has a link to its geographical information system (GIS) mapping data from the county homepage⁶⁰. From this site, citizens can access information about the soils, hydrology, zoning and other features of the county.

Both of these websites are an important part of the county's efforts to provide quality information to its citizens. The county plans to publicize these resources so that people are aware of them and how to access them. All of these projects are being covered by the existing county budget.

COOP/COG Planning

As part of the Federal Fiscal Year (FFY) 2002 Supplemental Planning Grant, Kewaunee County Emergency Management began Continuity of Operations/Continuity of Government (COOP/COG) planning. This planning is done to identify the critical functions that each county department must have operational within 12 hours of a catastrophe. Kewaunee County would like to continue COOP/COG disaster planning. One element of this plan is having alternate emergency facilities such as Emergency Operations Centers (EOCs), Joint Information Centers (JICs) and Emergency Operating Facilities or EOFs, which would be used in a nuclear power plant incident.

A portion of Kewaunee County is in the Emergency Planning Zone (EPZ) for both the Kewaunee and Point Beach Nuclear Power Plants. Because of this, Dominion Energy provides some support for the county's emergency operations to be use in a nuclear power plant emergency. Dominion purchased a building in Green Bay to use as alternate EOC/JIC/EOF and Kewaunee County Emergency Management will be working with the company to equip the facility using grant money and budget funds. The estimated cost of equipping this facility, beyond what Dominion has already contributed, is \$75,000 - \$80,000.

- Completed a new county EOC in Luxemburg and moved to the facility in 2012.
- No alternate site has been identified as of yet because the new primary EOC project took precedence.

⁶⁰ <https://kewauneeeco.ags.ruekert-mielke.com/>

EPCRA Awareness

Kewaunee County believes that it is important for citizens to be aware of the requirements for reporting, usage and disposal of hazardous materials. Some awareness projects are required by the Emergency Planning and Community Right-to-Know (EPCRA) Program. Kewaunee County conducts two awareness campaigns in March and August. The March campaign usually occurs in conjunction with a Clean Sweep, which is a project where, for a defined period of time, citizens can deliver household hazardous wastes to a collection point without charge. Recurring projects such as these are led by the Emergency Management Department and are funded from a grant managed by Wisconsin Emergency Management (WEM) and by county budget dollars. Special projects have varying costs and there may be grants available to fund them.

Coastal Erosion

Physical Characteristics

Coastal erosion is defined as the wearing-away of land and the loss of beach, shoreline or dune material over a period of time as a result of natural coastal processes or human influences. Characteristics such as supply of sand and processes such as lake level change, currents, tides, waves and wind are natural factors that contribute to the rate of erosion. Human-caused contributors to erosion include dredging tidal entrances, jetty and groin construction, hardening shorelines with seawall, revetments, beach nourishment, construction of harbors and sediment-trapping dams in the river tributaries.

Coastal erosion affects Wisconsin along the shoreline of Lakes Michigan and Superior. Along the Great Lakes, cyclical changes in lake levels, disruption of longshore transport of beach building material and storms all influence the rate of erosion. According to the National Research Council, a congressionally chartered, non-profit organization that provides science and technology advice, annual variability in wave climate and lake levels causes the rates of bluff and dune erosion along the shores of the Great Lakes to vary from near zero to tens of feet per year.

As high-lake levels increase, bluff recession rates also increase. Increasing assaults by wave action against the base of the bluff cause erosion and beach-building sediments. Navigational improvements and dredge-material disposal practices deplete both tributary and shore land sources of sediment. Removing these sediments from the shore system contributes to erosion. Ice ridges that form and break up each winter along the shoreline cause erosion by trapping sand in floating fragments of ice that are carried offshore into deep water. This continual natural process is one of the principal mechanisms by which sand is lost from the near shore system.⁶¹

⁶¹ USGS, 1992

C
Coastal Erosion along Lake Michigan

Frequency of Occurrence

Coastal erosion is usually a gradual process, and sudden incidents prompting emergency action are rare. Such rare events include strong storms with high winds or heavy wave action that can cause sudden failure of bluffs.

All 15 coastal counties in Wisconsin experience erosion, flooding and damage to shoreline structures. Coastal erosion is a naturally occurring process that can accelerate during times of high water or wave action. For example, bluff erosion is more likely to occur during major storm events due to wave action upon the shoreline. The effects of wave-induced erosion are usually greater during those periods when the level of water is high. The freezing and thawing of lake ice also contribute to erosion.

Lake Michigan coastal erosion in Port Washington.

Record snowfall in northern Wisconsin in 1996 was followed by near record high-water levels in 1997. However, unusually mild weather and light snowfall in the winters of 1998–1999 and 1999–2000 brought lake levels to below long-term averages. According to the U.S. Army Corps of Engineers' Monthly Bulletin of Lake Levels for the Great Lakes, lake levels are more than one foot below normal in Lake Michigan. Water levels on Lake Michigan recovered somewhat in 2001 but remained below normal. Heavy above average rainfall in April 2002 [133% of average] improved low lake levels by as much as eight inches in summer 2002.

Many areas of the Wisconsin Great Lakes coast are vulnerable to bluff erosion. In general, the erodible sections of the Lake Michigan shore are found between the Illinois State line to the Sturgeon Bay Canal in Door County, and in the northeastern part of Brown County on Green Bay. Along the remainder of the Lake Michigan shore, bluff erosion is limited to smaller segments of bays and clay banks.⁶² In January, 2006 a 900' x 60' area fell from the bluffs in Ozaukee County; on average, there losses are two to three feet per year.

⁶² Springman and Born, 1979

Water levels in the Great Lakes fluctuate on both a seasonal and long-term basis. Seasonally, the lakes are at their lowest levels during the winter when much of the precipitation is held on land as snow and ice. The highest seasonal levels are during the summer when snowmelt from the spring thaw and summer rains contributes to the water supply. Long-term variation of lake levels depends on precipitation and evaporation trends in the Great Lakes watershed. Lake levels rise when net water supply exceeds outflow and above average lake levels can persist for extended periods even after the conditions that caused them have ended. The water volume of the Great Lakes is large and outflow from natural outlets is limited. Flow regulation structures exist in Lakes Ontario, Michigan and Superior, but their influence is limited by their size. Controlled releases strive to simulate long-term averages in an effort to serve multiple interests. The source of about 40% of Lake Superior's annual water supply is from the snowpack around its shores. Lakes Michigan and Huron get up to 30% of their yearly supply from Superior's snowmelt when it flows into the lower lakes.⁶³

Kewaunee County has a medium probability of coastal erosion in the future and the likelihood of damage due to coastal erosion is considered low.

Vulnerability

Existing maps depicting rates of coastal erosion and the FEMA HAZUS-MH inventory of structures in the coastal zone provided the basis for estimating the potential vulnerability and losses from this hazard. The number and types of structures subjected to high and low risk of erosion were determined from these data. The erosion risk zones were established based on the distance in miles from the Coastal Area Boundary.

The high erosion risk zone is defined as the area within 1/4 mile of the Coastal Area Boundary; the low erosion risk is 1/2 mile from the boundary.

The high erosion risk loss estimate for Kewaunee County includes 1,374 residential structures, 13 commercial structures and 1 government structure for a total of 1,388 structures. The estimated cost of residential loss is \$24,912,580, commercial loss is \$203,400 and government loss is \$15,800.

⁶³ Detroit Free Press, March 18, 2000

The low erosion risk loss estimate for Kewaunee County includes 1,977 residential structures, 14 commercial structures and 1 government structure. The estimated cost of residential loss is \$68,407,240, commercial loss is \$435,480 and government loss is \$31,600.

Based upon structure type and dimensions, including square footage, replacement values were estimated. The estimated replacement value was assumed to be equal to the value of a total loss of the structure due to erosion.

Replacement values for coastal structures were estimated and could be verified in future risk assessments.⁶⁴

Hazard Mitigation Strategies

The goal of coastal erosion mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to coastal erosion.

Coastal property owners are acutely aware of hazards during periods of high-water levels and especially right after a damaging storm or a bluff failure but this awareness can fade over time if low lake levels slow the erosion rate. Lake levels were above long-term averages from 1996 to 1998.

The last period of significantly higher lake levels was in 1985 to 1986, resulting in \$16 million of documented damage to public facilities alone.⁶⁵

The most effective mitigation measures are ensuring that municipalities, builders and homeowners all understand safe building procedures and that local zoning measures are current, understood and enforced. The current county ordinance, found in the Shoreland and Floodplain Ordinance, requires a 25' set-back from the bluff. A team was established to review/evaluate the plans, which is now complete. The Army Corps of Engineers was brought

⁶⁴ Wisconsin Hazard Mitigation Plan

⁶⁵ WCMP, 1992

in to provide expert opinions and accepted updates were completed by 2014.

In summer 2012, FEMA began conducting a comprehensive study of flood hazards for Lake Michigan and the rest of the United States Great Lakes⁶⁶ through FEMA's Risk Mapping, Assessment and Planning (MAP) Program. Data from this study will eventually be used to convey coastal flood hazard risk through revised Flood Insurance Rate Maps (FIRMs) (i.e., regulatory products) and new risk planning and assessment products and datasets (i.e., non-regulatory products and datasets). The goal of Risk MAP is to support actions that make communities safer from flooding. The Risk MAP⁶⁷ program wants to achieve continued improvement of flood hazard information for the National Flood Insurance Program (NFIP); to promote increased awareness and understanding of flood risk; to increase community engagement; and to identify and support actions that local stakeholders can take to reduce natural hazard risks. Kewaunee County and its coastal communities will support this activity as requested and invited by FEMA.

Over time, ensuring adequate zoning measures and providing good public information regarding coastal erosion to those potentially affected will be the best strategies to reduce damages to existing or future buildings and infrastructure but the county also plans to continue studying the coastal erosion issue and will conduct any remediation actions that can be funded via grants or local dollars.

- The public has easy access to the Land Records information via website. Information regarding permits can also be accessed.
- Will continue to discuss safe building procedures with residents when they come in for permits.
- NR115 will be updated on shoreland permitting in 2014.

⁶⁶ <http://www.greatlakescoast.org>

⁶⁷ http://www.fema.gov/plan/prevent/fhm/rm_main.shtm

Drought and Dust Storms

Two types of drought occur in Wisconsin: agricultural and hydrologic. Agricultural drought is a dry period that reduces crop yields. Hydrologic drought is a dry period of sufficient length and intensity to affect lake and stream levels and the height of the groundwater table. These two types of drought may, but do not necessarily, occur together.

Agricultural drought in a Wisconsin corn field in 2012.

Dust storms result from a combination of high winds and dry, loose soil conditions. While high winds and periods of drought have each occurred in Kewaunee County, there has never been a recorded dust storm event. Since natural hazards that have occurred in the past are more likely to occur in the future, it is unlikely that a dust storm event will occur in Kewaunee County. This assertion is further bolstered by the fact that there is very little irrigation done within the county and that the soils in Kewaunee County are not prone to blowing. While there are concerns about topsoil erosion and some mitigation activities may be planned that would reduce the effects of these types of events, they will not be a major focus of this plan.

Physical Characteristics

The understanding that a deficit of precipitation has different impacts on groundwater, reservoir storage, soil moisture, snowpack and streamflow led the development of the Standardized Precipitation Index (SPI) in 1993. The SPI quantifies the precipitation deficit for multiple time scales. These time scales reflect the impact of drought on the availability of the different water

resources. Soil moisture conditions respond to precipitation anomalies on a relatively short scale. Groundwater, streamflow, and reservoir storage reflect longer-term precipitation anomalies. For these reasons, the SPI is calculated for 3-, 6-, 12-, 24- and 48-month time scales.

The SPI calculation for any location is based on the long-term precipitation record for a desired period. This long-term record is fitted to a probability distribution, which is then transformed into a normal distribution so that the mean SPI for the location and desired period is zero. Positive SPI values indicate greater than median precipitation and negative values indicate less than median precipitation. Because the SPI is normalized, wetter and drier climates can be represented in the same way and wet periods can also be monitored using the SPI.

The classification system shown in the SPI values table (below) defines drought intensities resulting from the SPI. The criteria for a drought event are also defined for any of the time scales. A drought event occurs any time the SPI is continuously negative and reaches an intensity of -1.0 or less. The event ends when the SPI becomes positive. Each drought event, therefore, has a duration defined by its beginning and end and an intensity for each month that the event continues. The positive sum of the SPI for all the months within a drought event can be termed the drought's "magnitude." Current SPI maps for the United States can be found online.⁶⁸

SPI Values ⁶⁹	
2.0+	Extremely wet
1.5 to 1.99	Very wet
1.0 to 1.49	Moderately wet
-0.99 to 0.99	Near normal
-1.0 to 1.49	Moderately dry
-1.5 to -1.99	Severely dry
-2.0 and less	Extremely dry

The Palmer Index is an older scale and is used more often by governmental organizations. It is effective in determining long-term drought (i.e., over several months) and is not as good with short-term forecasts (i.e., weeks.) It uses zero as normal; drought is

⁶⁸ <https://www.ncdc.noaa.gov/temp-and-precip/drought/nadm/indices/spi/div#select-form>

⁶⁹ <https://drought.unl.edu/ranchplan/DroughtBasics/WeatherandDrought/MeasuringDrought.aspx>

shown in terms of negative numbers and excess moisture is reflected by positive figures. The future incidence of drought is highly unpredictable and may also be localized, making it difficult to determine probability with any accuracy.

Drought conditions may vary from below-normal precipitation for a few weeks to a severe lack of normal precipitation for several months. Drought primarily affects agricultural areas because the amount and timing of rainfall has a significant impact on crop production. The severity of a drought cannot therefore be completely measured in terms of precipitation alone but must include crop yields.

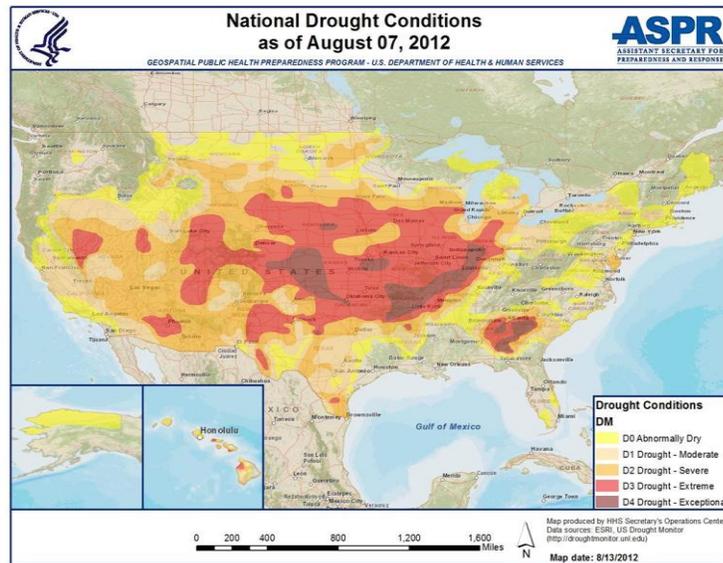

Frequency of Occurrence

Drought is a relatively common phenomenon in Wisconsin and has occurred statewide in 1895, 1910, 1939, 1948, 1958, 1976, 1988, 1992, 2003, 2005 and 2012. The 1976 drought received a Presidential Emergency Declaration with damage to 64 Wisconsin counties, including Kewaunee. Estimated losses of \$624 million primarily affected the agricultural sector. Reports show that Kewaunee County was as affected as the rest of the state in this drought, receiving money for emergency feed programs for livestock and for increased fire protection of its wilderness areas. It should be noted that only 19% (\$119,434,924) of this loss was compensated by any federal program.

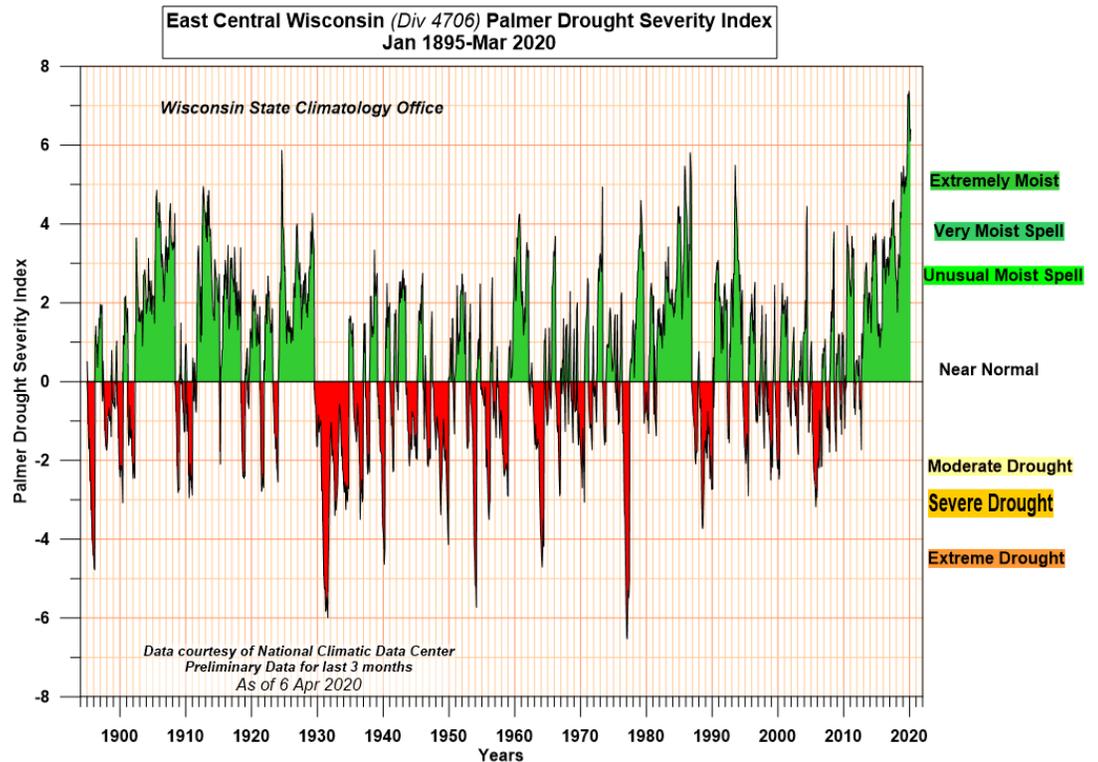

The 2012 heat wave resulted in significant droughts across more than half the country as well as increases in heat related illnesses and deaths. July, 2012 was the hottest month in US history, eclipsing the record set during the heart of the Dust Bowl in 1936. The worst of the heat was in the Midwest, the Plains and along the Eastern Seaboard. Most of the contiguous US had record and near-record warmth for the seven-month period, except the Pacific Northwest, which was near average. The August 7, 2012 Drought Monitor map shows 52.27% of the United States and Puerto Rico in moderate drought or worse with Kewaunee County in the D0 – Abnormally Dry category to not significantly affected.⁷⁰

⁷⁰ 2012 Heat & Drought Federal Report, HHS ESF 8, UPDATE #2, U.S. Department of Health and Human Services, Assistant Secretary for Preparedness and Response

Drought and Dust Storms

The Palmer Index chart for the years between January 1895 and October 2018 in East Central Wisconsin, which includes Kewaunee County, follows:⁷¹

⁷¹ <http://www.aos.wisc.edu/~sco/clim-watch/graphics/pdsi-ts-06-l.gif>

As can be seen from the frequency table above, Kewaunee County regularly experiences drought to at least a moderate level two to three times every ten years. While drought is a regular occurrence, it is generally very difficult to predict with any accuracy but according to the Wisconsin Hazard Mitigation Plan, “the NWS and National Integrated Drought Information System (NIDIS) are improving methodology to accurately forecast drought conditions. Both organizations use a combination of current and historical precipitation, streamflow, ground water, and crop data to perform short-term and long-term forecasts.”⁷²

On July 15, 2005, the Governor declared a drought emergency for the entire state of Wisconsin. This declaration, the first since August 2003, allowed farmers access to additional water for crop irrigation. The summer of 2012 was also extremely hot and dry across much of the United States, including Wisconsin. A table showing the drought events recorded by the National Weather Service for Kewaunee County can be found in Appendix B.

Considering past occurrences, it can be surmised that Kewaunee County has a medium probability of drought occurrence in the future and the likelihood of damage due to drought is considered high for agricultural losses and low for other types of losses. The probability of dust storm and damages due to dust storms would be low.

Vulnerability

Droughts and dust storms could impact Kewaunee County disproportionately because a large portion of the land area is used for agricultural activities. Drought generally impacts farm output by reducing crop yields and the health and product output (e.g., milk) of livestock. As a result, a drought will seriously impact the economy of the entire county. Dust storms impact farms in the long term by blowing away the top levels of soil, which are the richest. This could economically impact the county by reducing its long-term viability for farming. The concern for agricultural losses due to drought is difficult to estimate because each incident will impact the county differently based on the length of the drought, when it occurs in the planting season and which crops were planted in various locations in that particular season but one can see, by looking at the agricultural statistics listed below, that this sector is

⁷² State of Wisconsin Hazard Mitigation Plan, p. 3-100

an important part of the Kewaunee County economy and that the losses could be considerable:

- Average size of farms: 190 acres
- Average value of agricultural products sold per farm: \$114,551
- Average value of crops sold per acre for harvested cropland: \$193.92
- The value of livestock, poultry, and their products as a percentage of the total market value of agricultural products sold: 76.66%
- Harvested cropland as a percentage of land in farms: 72.41%
- Average number of cattle and calves per 100 acres of all land in farms: 35.43
- Corn for grain: 24,016 harvested acres
- All wheat for grain: 7,867 harvested acres
- Soybeans for beans: 13,006 harvested acres
- Vegetables: 2,285 harvested acres
- Land in orchards: 151 acres⁷³

Drought is also a major risk factor for wildfire and can reduce the amount of surface water available for recreational activities (e.g., boating, fishing, water skiing) and for wildlife. This is important because, for example, low water levels can lead to an outbreak of disease (e.g., botulism) in migratory bird pools.

Prolonged drought can also impact the groundwater reserves. This can reduce the ability of the municipal water services and rural individuals on wells to draw adequate fresh water. This may especially impact rural homeowners who tend to have wells that are not drilled as deeply as municipal wells. In Kewaunee County, the population that lives outside of the cities and villages are generally on well water. There could also be a safety risk during dust storms if they are severe enough to reduce the visibility of the roadways for drivers.

Hazard Mitigation Strategies

The goal of drought and dust storm mitigation activities is to ensure that the water resource, on which all of the county relies for living, farming, industry and fire protection, is available even during times of scarcity.

⁷³ http://www.city-data.com/county/Kewaunee_County-WI.html

The Village of Luxemburg and the Cities of Algoma and Kewaunee have ordinances in their municipal codes that regulate the usage of water during times of drought. To mitigate the effect of hydrologic drought, the following actions are being taken:

- Identification of areas with potential ground water level problems,
- Inspections of wells in those areas for adequate depth and construction and
- Adoption of water usage regulations during drought conditions.

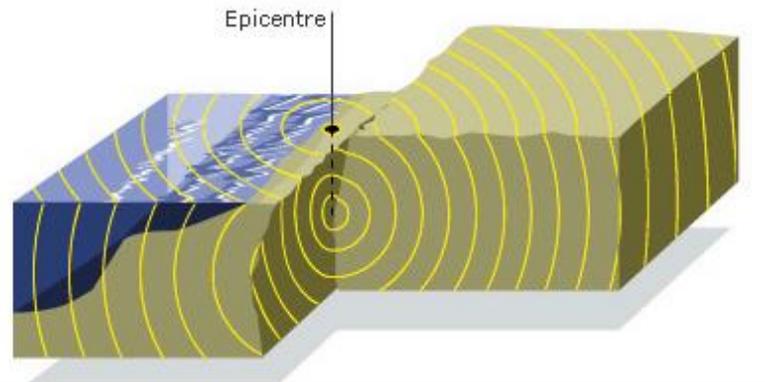

Conservation and water usage regulation information is available to members of the general public on a regular basis and outreach campaigns occur during periods of drought. The County Emergency Management Department will continue placing high-quality water conservation website links on their preparedness information page. The costs associated with these measures vary by program and will be paid for from the regular operating budget.

Kewaunee County farmers can contact the Kewaunee County University of Wisconsin Extension Office or the Department of Consolidated Farm Services Agency for information and guidance related to drought. Various federal and state publications are available from these agencies on ground water movement, the hydrologic cycle, irrigation methods and crop insurance. These agencies will also be the lead agencies in obtaining emergency food and water supplies for agricultural use. The UW – Extension Office will also increase efforts to conserve milk house water.

The hazard mitigation strategies listed above primarily involve providing information on water conservation measures to farmers and the public. Water conservation will ensure that the resource is available for critical residential, business and agricultural uses (drinking, food irrigation, manufacturing, firefighting) and good farming practices may help prevent erosion of the topsoil found in Kewaunee County. Since drought and dust storms are not hazards that affect buildings or traditional infrastructure (e.g., bridges, culverts) these strategies did not need to be designed to reduce damages to existing or future buildings and infrastructure.

Earthquakes

An earthquake is a shaking or sometimes violent trembling of the earth which results from the sudden shifting of rock beneath the earth's crust. This sudden shifting releases energy in the form of seismic waves (wave-like movement of the earth's surface.)⁷⁴

Physical Characteristics

Earthquakes can strike without warning and may range in intensity from slight tremors to great shocks. They can last from a few seconds to over five minutes and they may also occur as a series of tremors over a period of several days. The actual movement of the ground during an earthquake is seldom the direct cause of injury or death. Casualties usually result from falling objects and debris because the shocks have shaken, damaged or demolished buildings and other structures. Movement may trigger fires, dam failures, landslides or releases of hazardous materials that compound an earthquake's disastrous effect.

Earthquakes are measured by two principle methods: seismographs and human judgment. The seismograph measures the magnitude of an earthquake and interprets the amount of energy released on the Richter Scale, a logarithmic scale with no upper limit. For example, an earthquake measuring 6.0 on the Richter Scale is ten times more powerful than a 5.0 and 100 times more powerful than a 4.0. This is a measure of the absolute size or strength of an earthquake and does not consider the effect at any specific location. The Modified Mercalli Intensity (MMI) Scale

⁷⁴ http://news.bbc.co.uk/2/shared/bsp/hi/pdfs/earthquake_guide.pdf

measures the strength of a shock at a particular location (i.e., intensity.)

A third less often used way of measuring an earthquake's severity involves comparing its acceleration to the normal acceleration caused by the force of gravity. The acceleration due to gravity, often noted "g," is equal to 9.8 meters per second. Peak Ground Acceleration (PGA) measures the rate of change of motion relative to the rate of acceleration due to gravity and is expressed as a percentage. These three scales can be roughly correlated, as expressed in the table that follows:⁷⁵

Earthquake PGA, Magnitude and Intensity Comparison Table			
PGA [%g]	Magnitude [Richter]	Intensity [MMI]	Description [MMI]
<0.17	1.0 - 3.0	I	I. Not felt except by a very few under especially favorable conditions.
0.17 - 1.4	3.0 - 3.9	II - III	II. Felt only by a few persons at rest, especially on upper floors of buildings. III. Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
1.4 - 9.2	4.0 - 4.9	IV - V	IV. Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing cars rock noticeably. V. Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
9.2 - 34	5.0 - 5.9	VI - VII	VI. Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight. VII. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
34 - 124	6.0 - 6.9	VII - IX	VIII. Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned. IX. Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
>124	7.0 and higher	VIII or higher	X. Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent. XI. Few, if any [masonry] structures remain standing. Bridges destroyed. Rails bent greatly. XII. Damage total. Lines of sight and level are distorted. Objects thrown into the air.

⁷⁵ Wald, Quitoriano, Heaton and Kanamori, 1999

Earthquakes

Most of Wisconsin's occurrences have not been severe, with only one registering 5.1 on the Richter Scale.

Frequency of Occurrence

Earthquakes that have affected Wisconsin from 1899 to 1987 are listed in the table that follows. The most severe earthquake in Wisconsin was the record earthquake of 1811, centered along the New Madrid Fault. Most earthquakes that do occur in Wisconsin are very low in intensity and can hardly be felt. These very minor earthquakes are fairly common, occurring every few years. Events of moderate magnitude have occurred in locations in Illinois and Michigan. Those and other stronger earthquakes centered in other parts of the country have been felt primarily in Southern Wisconsin.

Date	Location	Latitude North	Longitude West	Maximum Intensity	Magnitude
10/12/1899	Kenosha	42° 34'	87° 50'	II	3.0
3/13/1905	Marinette	45° 08'	87° 40'	V	3.8

Also in Wisconsin, a 2012 article published in the Milwaukee Journal-Sentinel discussed an incident in Waupaca County that was not an earthquake as traditionally discussed and understood. This episode is highlighted in this plan because it was widely reported in the state and could be a concern for Kewaunee County citizens:⁷⁶

A 1.5-magnitude earthquake was recorded at 12:15 a.m. March 20 beneath Clintonville, according to the National Earthquake Information Center. The center is operated by the U.S. Geological Survey.

The U.S. Geological Survey said several days of booms and vibrations that rattled windows and nerves last week likely were caused by a swarm of small earthquakes.

Scientists at the Wisconsin Geological and Natural History Survey in Madison said the low-intensity seismic activity could have been produced by a phenomenon known as postglacial rebounding.

Granite bedrock beneath eastern Waupaca County is slowly adjusting to a great weight being lifted off it when the last glacier melted more than 10,000 years ago. As the granite stretches, rising only a few millimeters a year, it can crack to relieve pressure, according to David Hart, a geophysicist at the Wisconsin Geological and Natural History Survey.

As it cracks, one piece slides or shifts places, releasing enough energy to create a seismic wave that rises to the surface.

There is no known geologic fault beneath central Wisconsin so the postglacial rebounding is the only thing stretching the bedrock crust in the state, Hart said.

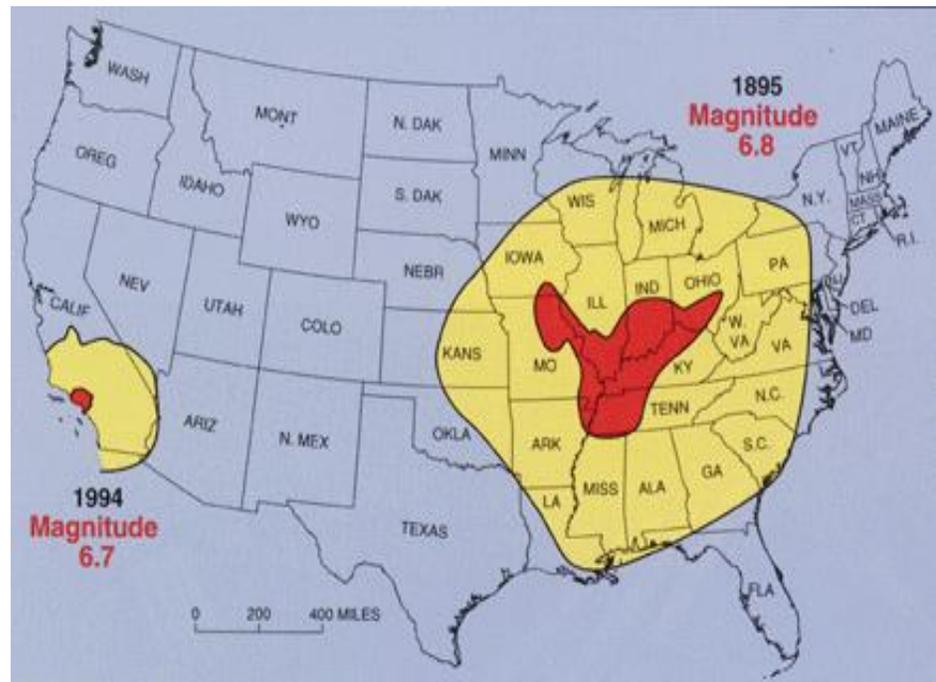

This phenomenon was widely reported in local, state and national news and drew interest from the public.

The nearest major active fault is the New Madrid Fault, stretching along the central Mississippi River Valley in Missouri. In recent years, considerable attention has focused on seismic activity in the New Madrid seismic zone that lies within the central Mississippi Valley, extending from northeast Arkansas through southeast Missouri, western Tennessee and western Kentucky to southern Illinois. Scientists at the Center for Earthquake Information have

⁷⁶ <http://www.jsonline.com/news/wisconsin/rumbling-booming-resumes-in-clintonville-6e4p9o8-144653925.html>

Earthquakes

computed a set of probabilities that estimates the potential for different magnitude earthquakes to occur at the New Madrid Fault. Even an 8.3 magnitude earthquake at the New Madrid Fault, however, would cause only minor damage in the southeastern corner of Wisconsin. At this time, it is not possible to predict the exact date, duration or magnitude of an earthquake.

As seen on the map in Appendix A, the earthquake threat to Kewaunee County is considered very low (the 50-year acceleration probability is 2%.) Minor damage (e.g., cracked plaster, broken windows) from earthquakes has occurred in Wisconsin but most often the results have been only rattling windows and shaking ground. There is little risk except to structures that are badly constructed. Most of the felt earthquakes reported have been centered in other nearby states. The causes of these local quakes are poorly understood and are thought to have resulted from the still-occurring rebound of the earth's crust after the retreat of the last glacial ice. The likelihood of damage from an earthquake is also low.

Vulnerability

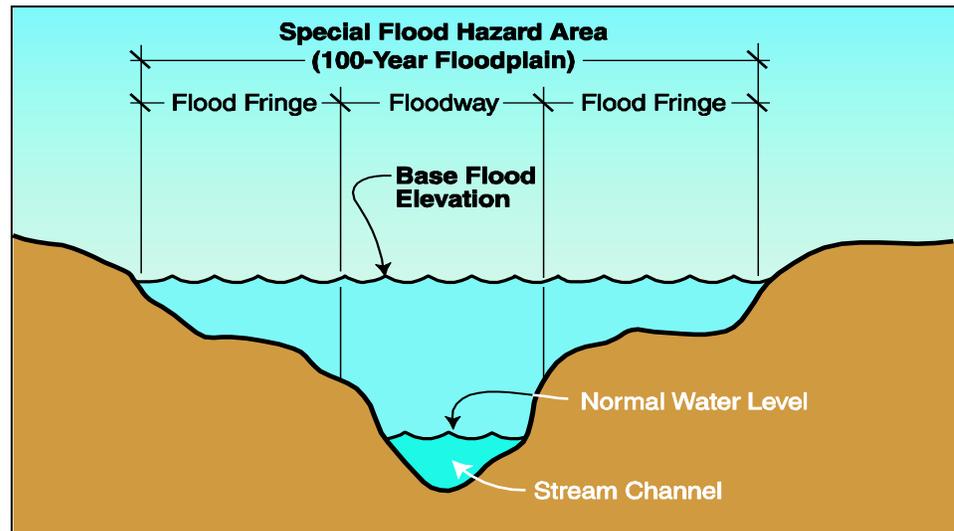

Any impact in the community from earthquake would likely be due to a few broken windows and personal effects that fell in the earthquake. The damage to critical infrastructure and buildings would be negligible although there could be indirect effects from any unlikely losses to the electrical grid, transportation routes/goods shipments and pipelines.

Hazard Mitigation Strategies

Since Kewaunee County is not likely to suffer directly from a severe earthquake, the community impacts are not considered significant and mitigation planning for this hazard is not necessary. If there is ever a need, obviously emergency resources will be mobilized but the goal for this section of the plan is therefore to educate on the very low risks of earthquake damage in Kewaunee County.

Flooding and Dam Failure

Flooding is defined as a general condition of partial or complete inundation of normally dry land (i.e., the floodplains) caused by the overflow of inland waters or the unusual and rapid accumulation or runoff of surface waters from any source. Floodplains are the lowlands next to a body of water that are susceptible to recurring floods.⁷⁷

Floods are common in the United States, including Wisconsin, and are considered natural events that are hazardous only when adversely affecting people and property.

Physical Characteristics

Major floods in Wisconsin usually have been confined either to specific waterways or to locations that receive intense rainfall in a short period of time.

Flooding that occurs in the spring due to snow melt or during a period of heavy rain is characterized by a slow build-up of flow and velocity in rivers and streams over a period of days. This buildup continues until the river or stream overflows its banks, for as long as a week or two, then slowly recedes. Generally, the timing and

⁷⁷ FEMA, August 2001

location of this type of flooding is fairly predictable and allows ample time for evacuation of people and property.

For prediction and warning purposes, floods are classified by the National Weather Service into two types: those that develop and crest over a period of approximately six hours or more and those that crest more quickly. The former are referred to as "floods" and the latter as "flash floods". Flash flooding occurs solely from surface runoff as a result of intense rainfalls. Flash flooding occurs less frequently in Wisconsin than flooding associated with spring snow melt. This type of flooding, however, is unpredictable. These are a particular concern in Kewaunee County because the topographical profile of the county is generally flat.

Generally, the amount of damage from flooding is a direct consequence of land use. If the ground is already saturated, stripped of vegetation or paved, the amount of run-off increases, adding to the flooding. There are also some clay soils in Kewaunee County. These are heavy soils that require more detention and contribute more to surface flooding than sandy or loamy soils. There is concern regarding the loss of topsoil and erosion due to flooding.

Terms commonly used when referring to flooding are "100-year flood" and "flood plain." A "100-year flood" is defined as a flood having a one percent chance of being equaled or exceeded in magnitude in any given year.

Flood Probability Terms Table⁷⁸

Flood Recurrence Intervals	Percent Chance of Occurrence Annually
10 year	10.0%
50 year	2.0%
100 year	1.0%
500 year	0.2%

The Wisconsin Department of Natural Resource (DNR), working with local zoning offices, has designated flood plain areas as those

⁷⁸ State of Wisconsin Hazard Mitigation Plan.

places where there is the greatest potential for flooding. Flooding may also occur due to a dam breach or overflow. Dams are barriers built across a waterway to store, control or divert water and a dam failure is a failure of the dam that causes downstream flooding. Failures may be caused by technological events (e.g., materials failure) or by natural events (e.g., landslide, earthquake) with flooding being the most common result.

According to the Wisconsin Department of Natural Resources (WDNR) Dam Safety Program here are approximately 3,800 dams in existence in the State of Wisconsin. Since the late 19th century, more than 700 dams have been built, then washed out or removed. Since 1967, approximately 100 dams have been removed. Almost 60% of the dams in Wisconsin are owned by a former company or private individual, 9% by the State of Wisconsin, 17% by a municipality such as a township or county government and 14% by other ownership types.

The federal government has jurisdiction over most large dams in Wisconsin that produce hydroelectricity - approximately 5% or nearly 200 dams. The Wisconsin Department of Natural Resources regulates the rest of the dams. A dam with a structural height of over 6 feet and impounding 50 acre-feet or more, or having a structural height of 25 feet or more and impounding more than 15 acre-feet is classified as a large dam. There are approximately 1,160 large dams in the State of Wisconsin.

Kewaunee County has 22 dams included in the Wisconsin Department of Natural Resources (DNR) database.⁷⁹

Kewaunee County has no electric power-generating dams and there are no dams in other counties that pose a significant flooding risk to the citizens of Kewaunee County.

One potential effect of flooding is erosion. Erosion is defined as the removal of soil by the force of waves, currents and/or ice at a lakeshore or streambank or by the power of wind or water on open land. Erosion is a natural process that can be accelerated by natural disasters (e.g., flooding, heavy rains, strong winds, drought) or by human activity (e.g., removal of plants/trees, tilling.) The county and municipalities monitor streambanks, especially after heavy rains and flash flooding, to check for erosion.

Watersheds

The major Kewaunee County watershed is Lake Michigan. There are six watersheds. They are:

- Ahnapee River Watershed
- East Twin River Watershed
- Kewaunee River Watershed
- Red River and Sturgeon Bay Watershed
- Stony Creek Watershed
- West Twin River Watershed

The maps in Attachment A show the watershed boundaries and 100-year flood plains for the entire county

Ahnapee River Watershed ⁸⁰

The Ahnapee River Watershed is located in northeastern Kewaunee County and south-central Door County and is 86,772 acres in size. It contains 189 miles of streams and rivers, 5,768 acres of lakes and 15,037 acres of wetlands. The watershed is dominated by agriculture (71%) and wetlands (17%) and is ranked high for nonpoint source issues affecting streams and groundwater.

East Twin River Watershed ⁸¹

The East Twin River Watershed is bordered on the east by Lake Michigan in Kewaunee and Manitowoc counties and is 117,493 acres in size. The watershed contains 314 miles of streams and river, 12,446 acres of lakes and 14,181 acres of wetlands. The watershed is dominated by agriculture (75%) and wetlands (12%) and is ranked high for nonpoint source issues affecting streams, lakes and groundwater.

Streams in the East Twin Watershed flow southeastward through southern Kewaunee County and northern Manitowoc County to the City of Two Rivers where it enters Lake Michigan. The 101,196-acre watershed is split nearly evenly between Kewaunee and Manitowoc Counties with 42,932 acres (42.5%) in Kewaunee County and 58,264 acres (57.5%) in Manitowoc County (WCD 1966 and 1968). Soils in the watershed range from poorly drained organic soils in the north, to gently sloping clays in the central basin to well drained sandy loams near Lake Michigan. Most of the clay-loam soils are fine textured and easily erodible, which can lead to water quality impacts. The predominant land use in the watershed is agriculture, although a substantial amount of land is forested. Other activities account for only sixteen percent of the land use in the watershed.

Kewaunee River Watershed ⁸²

The Kewaunee River Watershed is located in Kewaunee County and the eastern edge of Brown County and is 91,009 acres in size. It contains 295 miles of streams and rivers and 7,313 acres of wetlands. The watershed is dominated by

⁸⁰ <https://dnr.wi.gov/water/watershedDetail.aspx?key=924727>

⁸¹ <https://dnr.wi.gov/water/watershedDetail.aspx?key=924726>

⁸² <https://dnr.wi.gov/water/watershedDetail.aspx?key=924924>

agriculture (75%) and is ranked high for nonpoint source issues affecting streams and groundwater. Upper reaches of the watershed have forage fisheries because of low flows and warm water temperatures. Most of the remainder of the watershed supports warm water sport fisheries, although several tributaries and one section of the Kewaunee River are designated as trout fisheries. All perennial streams within the watershed experience seasonal anadromous migrations of trout and salmon from Lake Michigan. The Wisconsin Department of Natural Resources (WDNR) built and operates an egg collection facility for Lake Michigan trout and salmon on the lower portion of the Kewaunee River. Water quality has been and still remains a major concern within the watershed. Based on watershed models, it is estimated that the Kewaunee River delivers 1,900 tons of sediment per year to Lake Michigan (WDNR 1995). Along with sediment, phosphorus, nitrogen and manure can be found in runoff reaching the Kewaunee River. It was estimated that between 1969 and 1978 the average phosphorus load of the river was 42,000 pounds per year with values ranging from 11,000 pounds/year to 106,000 pounds/year (WDNR 1984). Because of high levels of point and nonpoint source pollution, the Kewaunee River was designated as a Priority Watershed in 1982. When the Priority Watershed program ended on the Kewaunee River in 1992, 89 of 300 landowners had agreed to participate in the program. Although low in percentage, participation was average for Priority Watersheds begun in this time period. The effectiveness of phosphorus/sediment reduction practices in this project was never measured.

Agriculture is the most common land use in the watershed with almost three-quarters of the total area. Ten percent of the watershed has been identified as wetlands, and forests cover another seven percent. Over three percent of the total area can be described as suburban environments. Open space and open water together with grasslands claim the last sizeable land use percentages for the Kewaunee River Watershed with two percent of the total area, each. Urban landscapes are even scarcer in the watershed with only two-fifths of one percent land cover.

The Kewaunee River Watershed is ranked as a high priority overall for nonpoint source (NPS) pollution and is similarly ranked for groundwater and stream NPS pollution. Lakes

within the watershed, however, are not yet ranked for NPS pollution. Runoff Events Runoff events occur regularly within the Kewaunee River Watershed. This is a significant issue since these runoff events degrade water quality, cause abundant algae growth in the stream, and degrade the fishery. CAFOs Several concentrated animal feeding operations (CAFOs) are located with the Kewaunee River Watershed, including Dairyland Farms, Da-Ran Dairy LLC, Kinnard Farms, Inc., Pagels Ponderosa Dairy, Rolling Hills Dairy Farm, Stahl Bros. Dairy LLC, and Stahl Farms. These dairy farms all have permits to discharge animal waste water to the ground, and ultimately to groundwater.

Red River and Sturgeon Bay Watershed ⁸³

The Red River and Sturgeon Bay Watershed is located primarily in Door County, but also covers the northwestern corner of Kewaunee County and the northeastern corner of Brown County. The watershed is 89,060 acres in size and contains 149 miles of streams and rivers, 20,800 acres of lakes and 16,378 acres of wetlands. The watershed is dominated by agriculture (57%), wetlands (18%) and forest (14%), and is ranked medium for nonpoint source issues affecting streams and high for nonpoint source issues affecting groundwater.

Stony Creek Watershed ⁸⁴

The Stony Creek Watershed is located primarily in Door County with a small portion located in the northeastern tip of Kewaunee County. The watershed drains to Lake Michigan and is 34,558 acres in size. It contains 79 miles of streams and rivers, 7,425 acres of lakes and 8,746 acres of wetlands. The watershed is dominated by agriculture (61%) and wetlands (25%) and is ranked high for nonpoint source issues affecting streams and groundwater.

West Twin River Watershed ⁸⁵

The West Twin River watershed is one of seven watersheds within the Twin-Door-Kewaunee River Basin. The West Twin

⁸³ <https://dnr.wi.gov/water/watershedDetail.aspx?key=924730>

⁸⁴ <https://dnr.wi.gov/water/watershedDetail.aspx?key=924728>

⁸⁵ <https://dnr.wi.gov/water/watershedDetail.aspx?key=924725>

River watershed is located in north central Manitowoc and southeastern Brown Counties, with a small portion extending into southwestern Kewaunee County. Portions of the city of Two Rivers also lie within the watershed boundaries. Soils include primarily gently to steep sloping well-drained sands and loams, and some clay soils. Soils are loamy throughout the northwestern reaches. The West Twin River begins at the confluence of the Neshota River and Devils River and has a combined watershed area of 176 square miles. There are 29 named streams and rivers in the watershed and five lakes that are 10 acres or larger, as well as, a number of high-quality spring pond wetlands. The Land use is largely agricultural but some industries border the river in the city of Two Rivers. The Shoto dam, 5.9 miles upstream of the mouth, divides the West Twin River into upper and lower reaches. Lake Michigan seiche effects extend approximately 1.5 miles upstream of the mouth. In the reach below the dam, the river supports a good warm water fishery of northern pike, smallmouth bass, rock bass, perch and channel catfish. Anadromous (i.e., running) salmon and trout from Lake Michigan run seasonally up to the Shoto dam. Natural reproduction of coho and chinook salmon, rainbow trout and walleye in this reach is doubtful. The presence of these fish is attributed to WDNR stocking efforts. Nonpoint source water pollution effects in this reach are generally mitigated by a buffer of cattail marsh along the banks. The warm water fishery above the dam is limited by agricultural nonpoint source water pollution and low flows. This reach supports rock bass, channel catfish and northern pike. Two small sections (total of 1.1 miles) of the West Twin River above the dam are classified as Class II trout waters, but it is doubtful this use is being supported. The greater redhorse (*Moxostoma valenciennesi*) has been found in the West Twin-Neshota River system. This fish is listed as a threatened species in Wisconsin. Fisheries managers believe that the entire reach above the Shoto dam is being extensively affected by sediment deposition and nutrient enrichment from agricultural runoff and should be classified as a warm water fishery. This potential is only partially being supported and the fishery could be improved through nonpoint source controls. The dam at Shoto is limiting the fishery potential by blocking fish migration. Wetland restoration activities could improve runoff quality.

This watershed is primarily agricultural, with a smattering of towns and villages throughout the land area. Shoto, Rockwood, Kellnersville, Maribel, Cooperstown, Francis Creek, Denmark, Shirley and Langes Corners are located in this watershed, and a portion of the city of Two Rivers also lies within the watershed boundaries. Agriculture is the primary land use and, despite significant work to improve conditions, the West Twin runs clay brown for at least several days after rainfall events. Rural runoff (i.e. field erosion) is still a major issue in this watershed. However, significant resources have been expended to install manure storage facilities, reduce stream bank pasturing, and increase nutrient management planning. Yet, more work is needed; there continues to be significant runoff pollution from agricultural fields. This issue can be addressed through county conservation programs. However, there are some inadequacies in the programs, and recommendations are included for increasing agricultural runoff program effectiveness.

Point source dischargers to surface water include the village of Denmark and Kossuth Sanitary District wastewater treatment plants, Land O'Lakes Dairy, Maribel Caves Bottled Water, and Potts Blue Star Cheese. The Francis Creek, Kellnersville and Maribel village wastewater treatment plants, Aurrichio Cheese, Lakeside Packing, S & R Ellisville Dairy, and Stoer Dairy Farms discharge to groundwater.

Floodplain Regulations

Floodplain regulations have been in place in the cities, villages and towns of Kewaunee County for many years. The Department of Natural Resources requires that each municipality approve regulations that meet DNR guidelines. These regulations and guidelines result from the value of Wisconsin lakes and waterways and a desire to preserve them and to protect the people who reside near them. Unregulated development can lead to loss of lives and property during floods.

Chapter 614, Laws of Wisconsin 1965, requires counties to adopt regulations giving all lands within 300 feet of navigable rivers or streams protection from haphazard development. Under this legislation, Kewaunee County has adopted a zoning ordinance

which gives a measure of protection to watersheds. The law protecting flood plains was created to meet the following objectives:

- Reduce the hazards to life and property from flooding.
- Protect flood plain occupants from a flood which is or may be caused by their own land use, which is or may be undertaken without full realization of the danger.
- Protect the public from the burden of extraordinary financial expenditures for flood control and relief.

Encroachment on flood plains, including structures or fill, reduces the flood-carrying capacity.

Frequency of Occurrence

Wisconsin has experienced several major floods during the last two decades. The 1973 and 1986 floods revealed that no flood plains or urban areas in Wisconsin can be considered safe from damages. Mill-dams have developed leaks on occasion but have not caused any flooding problems.

Kewaunee County historically does not have a serious flooding problem. Kewaunee County has been included in two Presidential Disaster Declarations (in 1973 and 1990) based on the fact that they were contiguous to other counties with more damage.⁸⁶

- FEMA-376-DR-WI: on April 27, 1973, the President declared a Major Disaster as a result of severe storms and flooding. Kewaunee County was eligible for both Public and Individual Assistance as well as Hazard Mitigation.
- FEMA-874-DR-WI: on July 13- Aug 30, 1990, the President declared a Major Disaster as a result of severe storms, flooding and tornado. Kewaunee County was eligible for both Public and Individual Assistance as well as Hazard Mitigation.
- FEMA-DR-1284-WI: On August 16, 1999, the President declared a major disaster as a result of high winds and

⁸⁶ <https://www.fema.gov/disasters>

Flooding and Dam Failure

severe storms that occurred July 4, 1999 to July 31, 1999. The declaration was granted for Public Assistance.

On July 20, 2019, the City of Algoma received heavy rains which caused unprecedented flooding in the city. Over five inches of rain was reported in a 45-minute span. About five blocks of flooding occurred on city streets along the river and low-lying areas. No damages were reported after the water was pumped out by the following morning. 25 homeowners reported basement flooding.⁸⁷

Kewaunee County is also susceptible to flooding if there is high water in Lake Michigan. Also seen during the summer of 2019, the public boat launch was closed and commercial and recreational water traffic was altered due to high water levels.⁸⁸

⁸⁷ <https://doorcountydailynews.com/news/453029>

Kewaunee officials will close public boat launch due to high water levels

By Eric Peterson, FOX 11 News | Friday, June 28th 2019

[VIEW ALL PHOTOS](#)

KEWAUNEE (WLUK) – The high water levels on Lake Michigan mean this is the last weekend Kewaunee's city boat ramp will be open.

"We were hoping for increasing water levels a few years ago, but we're ready for it to quit now," said Tom Kleiman, Accurate Marine.

Record water levels for the month of June on the Great Lakes are causing concerns for many people up and down the Lake Michigan Shoreline.

FOX 11 NEWS NEWS WEATHER SPORTS INVESTIGATES CHIME IN WATCH

KEWAUNEE (WLUK) – The high water levels on Lake Michigan mean this is the last weekend Kewaunee's city boat ramp will be open.

"We were hoping for increasing water levels a few years ago, but we're ready for it to quit now," said Tom Kleiman, Accurate Marine.

Record water levels for the month of June on the Great Lakes are causing concerns for many people up and down the Lake Michigan Shoreline.

On a typical busy weekend, Kewaunee leaders say about 100 trucks and trailers can fill the parking lot at the city's public boat launch. On Friday morning, there were two. High water covers most of the landing.

"We're right at that level, and if it goes up more, we're going to see more issues," said Andy Holzem, Kewaunee Marina Manager.

Holzem says it's more than just flooding. He says weather conditions delayed construction on a new dock system, creating potholes beneath the swollen surface.

"There are open gravel pits basically at the top of these ramps, because we weren't able to finish them before the water got so high this year," said Holzem.

With public safety the priority, marina officials say they were forced to act.

"We're closing the ramp. Starting July first, at 8:00 in the morning, public works is going to put barricades up, and pull these ramps actually out," said Holzem.

But fishermen will still be able to launch their boats. At Salmon Harbor Marina nearby, the typically private boat landing will be available for public use.

"It's a very substantial ramp, that will take care of quite a few different vessels. But it is only one launch ramp, and it will create a back log, so we're asking that people understand during this unfortunate issue with the high water levels. We're doing our best," said Kleiman.

City leaders say they don't know how long the public landing will stay closed. The City's marina will remain open.

"Kewaunee is open for business. The fish are still biting, and Mother Nature threw a curve ball, but we'll get through it," said Holzem.

According to the U.S. Army Corps of Engineers, levels on Lake Michigan are expected to continue to rise in July, by another inch.

The following list summarizes damages attributed to flooding in Kewaunee County by the National Flood Insurance Program through 30 September 2018: ⁸⁹

Kewaunee County NFIP Loss Claims				
Jurisdiction	Total Loss	Closed Loss	Closed Without Payment	Total Payments
City of Algoma	7	3	4	\$ 5,240.38
Kewaunee County	4	3	1	\$ 40,106.42
City of Kewaunee	1	1	0	\$55,322.25

There was one repetitive loss property through 31 December 2018. The property is a single-family residential structure in the Town of Luxemburg with two claims.

Tables showing the flood and flash flood events recorded by the National Weather Service can be found in Appendix B. A careful review of the geography and history of flooding in Kewaunee County leads to the conclusion that there is a low probability of flash flooding in the future and a very low probability of damage and losses due to flash flooding. The likelihood of occurrence and the severity of damage is medium for river flooding. This flooding could occur due to urban stream flooding, flash flooding or, less likely, due to a dam failure.

Vulnerability

After flooding, whether caused by a storm or dam failure, there is often damage. Potential vulnerabilities due to flooding events can include flooded public facilities and schools, many of which are the community's shelters needed when individual housing is uninhabitable. Utilities are also vulnerable in floods, which can bring down electric lines/poles/transformers, telephone lines and can disrupt radio communications. The loss of communications can impact the effectiveness of first response agencies, which need to communicate via two-way radio to mount emergency response

⁸⁹ <http://bsa.nfipstat.fema.gov/reports/1040.htm>

and recovery activities. The public media communications utilized by emergency managers to provide timely and adequate emergency public information can also be impacted.

Residential structures may suffer from flooded basements, damaged septic systems and damaged functionals (e.g., HVAC systems, clothes washers and driers.) Homes may also be impacted by sewer back-up and, if the home is not properly cleaned after a flood, bacterial growth and mold may impact the home's air quality and cause illness among the occupants.

Businesses can suffer building and equipment damage similar to homes. Businesses may lose expensive product stored in basement or other low areas as well as the ability to operate from their facility. If the facility must close, its owners and employees will most likely suffer economic hardships beyond what their personal losses may have entailed. Agricultural business losses involve the loss of standing crops and harvests that are damaged by flooded storage facilities in the immediate time period. On a longer time scale, the erosion of topsoil by floodwaters can degrade the land and impact future crop yields.

Perhaps one of the most expensive types of flood damage is that to roadways, which are washed out, inundated and/or covered by debris, blocking access to emergency and general public traffic. An example of roadway damage can be seen in this picture from the August, 2010 flooding in Wisconsin.

Appendix F contains excerpts from the Kewaunee County HAZUS report. HAZUS-MH uses state-of-the-art geographic information system (GIS) software to map and display hazard data and the

results of damage and economic loss estimates for buildings and infrastructure. FEMA HAZUS-MH data were used to estimate the number of structures located within the one-percent chance, or 100-year floodplain, based upon Flood Insurance Rate Maps (FIRMs) published by the Federal Emergency Management Agency (FEMA), the results of which are outlined in the report.

Hazard Mitigation Strategies

Kewaunee County is committed to remaining compliant with the requirements of the National Flood Insurance Program (NFIP) and all other state and federal laws. According to the NFIP, the following communities participate in the program:

- Kewaunee County. Please note that the county participation covers the unincorporated municipal areas (i.e., the towns).
- City of Algoma
- City of Kewaunee
- Village of Casco
- Village of Luxemburg

There are no areas in Kewaunee County which have had special flood areas identified by FEMA but are not in the NFIP program. One hazard mitigation strategy selected is to inform the public about the availability of flood insurance; this task will be carried out by the County Emergency Management Office.

The plan is intended to identify areas that are particularly susceptible to flooding, assess the risks, analyze the potential for mitigation and recommend mitigation strategies where appropriate. The goals of this plan are:

- Goal 1: To reduce, in a cost-effective manner, the loss of lives and property due to these events. Another part of this goal is to promote safety and health in areas that have been or are prone to be flooded.
- Goal 2: To preserve and enhance the quality of life throughout Kewaunee County by identifying potential property damage risks and recommending appropriate mitigation strategies to minimize potential property damage during/due to flooding.

- Goal 3: To promote countywide planning that avoids transferring the risk from one community to an adjacent community.
- Goal 4: To ensure that all communities in Kewaunee County participate in the NFIP so that all county residents have access to affordable flood insurance coverage.
- Goal 5: To identify potential funding sources for mitigation projects and form the basis for project grant applications through FEMA's Pre-Disaster Mitigation (PDM) and/or Flood Mitigation Assistance (FMA) programs.

Short term actions that can lessen the effects of flooding include:

- Issuance of early warnings through flood advisory bulletins,
- Dissemination of instructions to the public through the media,
- Preparation of congregate care facilities and
- Evacuation of people and property.

Temporary protective measures such as sandbagging, protection of buildings and other structures and cut-off of gas and electricity may also be implemented. Presently, Kewaunee County maintains a limited stock of sandbags to assist with flood containment.

The current emphasis in flood mitigation is on long-range actions. Such actions include the adoption of proper floodplain zoning ordinances and land use planning. It has been shown that flood plain management reduces the cost of damages attributed to flooding. The mitigation measures contained within this plan should be consistent with other comprehensive planning activities. The Kewaunee County Land and Water Conservation Department enforces county zoning ordinances related to flood plains.

There is a need for review and updating of some of the flood-related data, information, plans and projects in the county including:

- The County Highway Department will use budgeted funding to work with the municipalities to ensure that a list of areas prone to roadway flooding is kept current. These areas will be evaluated for mitigation projects. The County Emergency Management Office will also assist with seeking grant funding sources for larger projects.

- Many of the planning decisions must be based on good mapping data and, as facilities and infrastructure change, that data must be updated to ensure that Kewaunee County is of the currency and detail that would be most useful for good flood management planning. The Water and Land Conservation Department will continue to monitor grant offerings and cost estimates to determine if projects are feasible. The project may also collect data regarding critical facilities and infrastructure in hazard areas so that the information is available for mitigation measure decision-makers.

Kewaunee County has some history of damage to buildings and infrastructure due to floods. In addition to the strategies listed above that deal with public information and planning, the community can make current and future buildings and infrastructure more disaster-resistant by:

- Using its maps and hydrology studies to ensure that properties at risk are identified and, as available, appropriate grants are sought and secured to mitigate losses. Good data also ensures that decision-makers can create and enforce appropriate zoning and/or building regulations to make any new structures disaster-resistant.
- Target old structures for buy-out and convert the land to open, public lands. This also eliminates future damages by preventing building on this land.
- Pre-identifying infrastructure (roads, bridges, culverts, shoulders) prone to flooding and directing current and future budgetary dollars to making the infrastructure disaster-resistant as it is scheduled for routine maintenance.

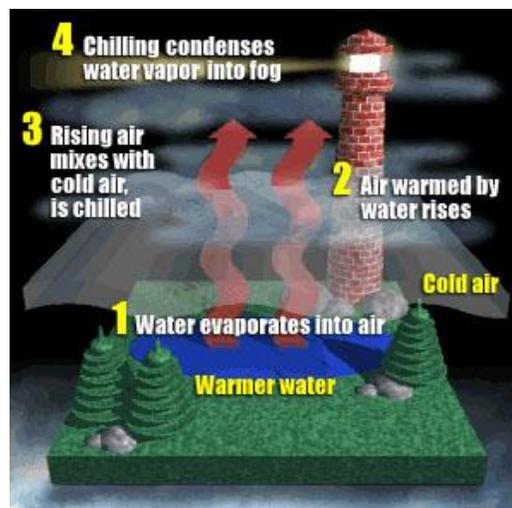

As described previously, the City of Kewaunee experienced some flooding in the summer of 2019. As a result, they are conducting the following hazard mitigation strategies and will explore other strategies as concerns are brought forward:

- **Lincoln St., Center St., Ellis St.** – Throughout winter, snow is hauled from these locations to reduce the volume of water in spring when the snow melts. Snow is also cleared away from the storm water catch basins before the spring melt. In the fall and spring, debris is removed from the catch basins to allow for proper drainage throughout the year.

- **Dodge St.** – Due to low elevation, water builds up on the north end of Dodge St. and the storm sewer there is prone to freezing. To minimize flooding, water is pumped from a stormwater manhole to an adjacent city property where the water naturally flows away.
- **Kilbourn St.** – Snow and debris frequently pile up on the east end of Kilbourn St which prevents water from draining. Snow and debris are frequently cleared from that area so the water can naturally drain to the east.
- **Hospital Rd.** – The elevation of Hospital Rd. is lower than surrounding fields in several locations. Significant volumes of water run off the fields which can cause flooding on the road. To minimize the flooding, the ditches are cleared and that the culvert is open so water can properly drain beneath the road.
- **Baumeister Dr.** – The west end of Baumeister Dr is lower than the surrounding fields. When snow melts it floods that intersection. Currently there is no storm sewer system at that location. To clear water from the intersection a pump is set that discharges to a storm water catch basin 600' to the north.

Fog

Because of its location between Lake Michigan and Green Bay, Kewaunee County has a long history dealing with fog, which at its most basic definition is a cloud based on the ground rather than in the atmosphere. As mentioned in the General Community Introduction section of this document, Native Americans lost in the offshore fog would call out "Kewaunee, Kewaunee," which is Potawatomi for "We are lost," hoping an answering call from the shore would guide them to safety. European settlers adopted the call for the official name of the community.

Physical Characteristics

Fog occurs when the air near the ground is saturated with moisture and condenses on tiny particles suspended in the air. These particles are called cloud condensation nuclei and actually attract water vapor molecules to their surfaces. Once condensation occurs on these tiny surfaces, the resulting liquid drops can remain suspended in the air because their weight causes them to descend slowly to the ground or be carried around by wind. The dew-point temperature, or saturation vapor pressure, can be reached by either adding more water vapor to the air or cooling the air down to the dew-point temperature. Fog is classified by the dominant formation process and exists as long as processes continue to

maintain saturated conditions. There are several basic types of fog:⁹⁰

- Radiation Fog is caused by cooling close to the earth's surface. The earth gives off long-wave radiation which on a clear night travels out into space. If the temperature drops to the dew point close to the ground, radiation fog can form. Radiation fog is also known as ground fog. The fog normally disappears soon after sunrise as the sun's warmth evaporates it.
 - Valley Fog is one type of Radiation Fog that forms in mountain valleys during winter and can be more than 1,500 feet thick. Often, the winter sun is not strong enough to evaporate the fog during the day. When the air cools again the following night, the fog often becomes thicker, which makes it even harder for the sun to burn it off the following day. These fogs can last for several days until strong winds blow the moist air out of the valley. The tendency for cool, dense air to pool at the bottom of valleys also enhances valley fog.
- Advection Fog results from the movement (advection) of warm, moist air from the south over a colder land mass. During the winter this is common when snow covers much of the Midwest. The snow cools the bottom portion of the moist airmass often resulting in condensation. The thickest advection fog usually forms during nights with light winds because humid air near the ground is not mixed with the drier air above. With light winds, the fog near the ground can become thick and reduce visibilities to zero; usually the fog burns off during the day but it can last many days if it is thick enough to block out the sun's light. This type of fog can occur almost anywhere in the United States, especially during winter warm-ups and early spring thaws. It can be widespread and very dangerous to commuters and aircraft travel.
- Evaporation Fog around Wisconsin is caused by cold air crossing over warmer bodies of water. The water evaporates its moisture into the colder air which immediately condenses it into clouds and fog. This is what

⁹⁰ <http://www.usatoday.com/weather/tg/wrainfog/wrainfog.htm>,
<http://www.usatoday.com/weather/wfog.htm>
<https://www.farmersalmanac.com/six-different-names-for-fog-20887>

looks like steam over Lake Michigan, inland lakes and rivers on a cold autumn or winter day. This rising fog can be found above thermal pools in Yellowstone National Park and is what you see when cool rain hits hot pavement. This may also be called “steam fog” or “sea smoke” when it forms over oceans. Sometimes this fog is lifted quickly and forms rotating whirls of fog known as *steam devils*.

- Upslope Fog is common near the Rockies, including the Denver area. If the winds are out of the east, the air flows up as it rises in elevation approaching the mountains. This can cool the air to its dew point and result in widespread fog.
- Rain Fog is created when late afternoon or evening showers and thunderstorms during the spring and summer leave the ground soaked just as the sun sets. Though the rain usually stops overnight, the high humidity level created by the rainfall won't allow the moisture to evaporate and as a result, fog forms. This occurs especially at times when there are light winds. As the air warms up the next morning, this rain-enhanced fog will usually burn off by midday.
- Precipitation Fog forms when rain or snow falls. As precipitation falls into drier air below the cloud, the liquid drops or ice crystals evaporate or sublimate directly into water vapor. The water vapor increases the moisture content of the air while cooling the air. This often saturates the air below the cloud and allows fog to form.

Frequency of Occurrence

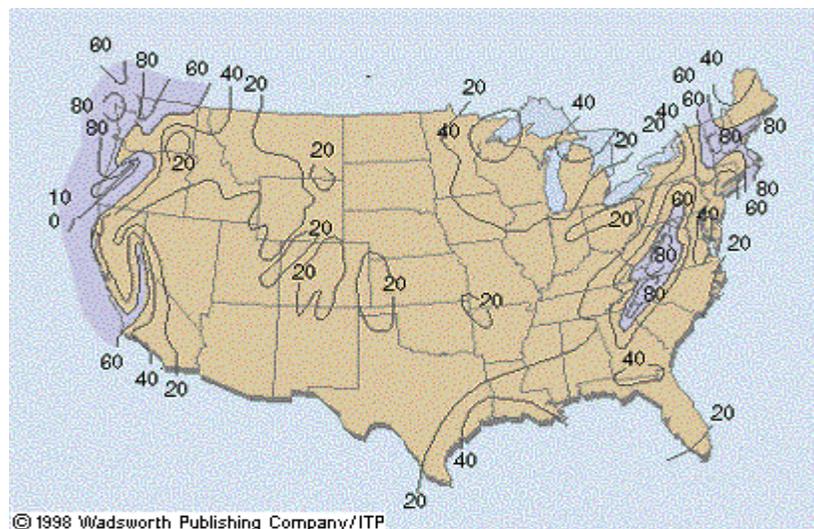

Some locations on this planet have weather conditions that are conducive to making fog frequently.

- San Francisco, California with an average of 18 days of heavy fog each year
- Cape Disappointment, Washington is the foggiest place on the western U.S. coast with an average of 106 days of heavy fog per year.
- The foggiest area on the east coast of the United States is found along the rockbound coast of Maine. Moose Peak Lighthouse on Mistake Island, at an elevation of 72 feet, averages 1580 hours of heavy fog each year. Many other locations have problems with fog, such as Eastport, Maine

with 65 days annually and Portland, with 55 days of heavy fog each year.

- Inland areas with regular heavy fog include parts of the Appalachian Mountains such as a peak area in West Virginia that averages over 100 days each year. Elkins, at an elevation of 1948 feet has about 81 days annually with heavy fog.
- Milwaukee averages about 26 days with some heavy fog and this is comparable to the fog seen in Kewaunee County.

Average Annual Number of Days with Heavy Fog in the United States

Tables showing fog events recorded by the National Weather Service can be found in Appendix B. Considering its geographical location, Kewaunee County has a high probability of fog occurrence in the future and the likelihood of damage due to fog is also considered low.

Vulnerability

Fog is a concern for the boaters, both commercial and recreational, who travel on Lake Michigan. While the U.S. Coast Guard does not publish reports showing the statistics for fatalities, injuries and property damage due to boating accidents involving fog, one can make a reasonable supposition that this is a concern based on the history of events in Kewaunee County. Boaters caught in heavy fog may strike another vessel, dock or natural feature such as a rock or bluff. The loss of a vessel may be compounded by the fact

that most fog occurs when the temperatures are colder and victims forced to evacuate their vessel may suffer from hypothermia more readily than they would in warmer months. Boaters may lose their way in the fog and fog makes it much more difficult for rescuers to find the victims to provide aid.

Perhaps the largest vulnerability to fog is due to automobile traffic crashes. According to the Wisconsin Department of Transportation, dense fog contributes to hundreds of car accidents per year in the state. Following are the Wisconsin Department of Transportation's statistics for fog-related traffic crashes from 1999-2004:

Death and Injury Statistics for Fog-Related Traffic Crashes						
	1999	2000	2001	2002	2003	2004
Total Crashes	1259	1008	1066	595	772	1141
Fatal Crashes	14	12	19	12	11	16
People Killed	15	13	22	22	11	19
Injury Crashes	528	445	425	238	274	423
People Injured	777	643	593	372	391	615
Property Damage Crashes	717	551	622	345	487	702

Traffic Conditions at the Time of Fog-Related Traffic Crashes						
	1999	2000	2001	2002	2003	2004
Total Crashes	1259	1008	1066	595	772	1141
Daylight	467	340	295	158	257	398
Dark/Lighted	130	107	130	324	80	140
Dark/Unlit	547	439	491	46	343	456
Dusk	9	18	16	56	7	16
Dawn	99	101	126	9	77	122
Unknown Light Conditions	7	3	8	2	8	9

Some notable fog-related traffic crashes in the area of eastern Wisconsin (which includes Kewaunee County) follow:

- On the morning of Friday, October 11, 2002, 50 vehicles were involved in a massive vehicle accident on Interstate 43 in Sheboygan County near Cedar Grove, Wisconsin. This accident was the deadliest pile-up in Wisconsin history with ten individuals killed (including Nadine Boltz, a Kewaunee resident) and over 40 people injured. Of the injured, seven were in critical condition and one was in serious condition at area hospitals immediately after the incident. 28 other people were treated and released for injuries ranging from burns to broken bones. The accident occurred as cars

heading south collided into one another as some vehicles slowed down in a dense fog. This led to a chain reaction as numerous cars were unaware of the scene hidden behind a veil of fog. Chad Kruse, a driver interviewed after the accident, described it by saying, "I entered the wall of fog, like someone took a blanket and threw it over the windshield." At the same time but separate from this incident, four other accidents occurred nearby on the interstate; all the individuals involved with these accidents survived.⁹¹

⁹¹ http://www.stoutonia.uwstout.edu/2002-2003/stories/021024/ne_04.html

- Fourteen people were injured in January 1996 in a 26-car pileup on southbound I-43 near Ozaukee County Highway KK. The first driver struck said he had missed his exit because of heavy fog and had slowed down to look for another when he was hit from behind.⁹²
- In March 1990, three people were killed and 31 injured in a 52-vehicle pileup on the Tower Drive Bridge in Green Bay after dense fog and smoke from nearby paper mills created a "white wall" that reduced visibility to less than 10 feet. The accident was believed to be triggered when a tanker truck overturned and a ruptured gas tank ignited. Vehicles following too closely on the fog-shrouded bridge slammed into the tanker and were engulfed by a sheet of flames.⁹³

Because Kewaunee County has a smaller population and does not have a major interstate, it is at less risk for very large, multi-car traffic accidents. The county does however have a major road, State Highway 42, which tracks right alongside Lake Michigan and does frequently have the kind of heavy fog that can lead to traffic accidents such as those listed above. While Highway 42 is not an interstate, it is a main thoroughfare for travelers within the county or going through to Door County, a major Wisconsin tourist destination.

It is also important to note that, as a smaller county, response to an accident relies on volunteer fire and EMS responders who generally have longer response times than the full-time departments found in more heavily populated areas. Also, there is no hospital within the county and crash victims will need to be transported to Door, Manitowoc or Brown County facilities for treatment. These factors can severely affect the medical outcomes of crash victims.

As seen in the true examples above, fog-related incidents can cause death, injury and property loss to the vehicle owners and occupants and their insurance companies. Responding governmental agencies also may suffer losses due to the cost of response, for damage done to roadways and structures due to fires and for potential injuries to responders working in a reduced-visibility zone. Citizens may be impacted by the closure of roadways and delay of activities; businesses may suffer losses due to the absence of workers due to delay, injury and/or death and

⁹² The Fog, The Deadliest Traffic Crash in Wisconsin History; Trooper Tim Austin; Wisconsin Trooper, Callan Publishing Ins., Minneapolis, MN; Spring 2003.

⁹³ <http://www.jsonline.com/news/state/oct02/87083.asp>

because of the delay of product on the roadways and direct loss of product in the crash (e.g., due to fire).

Hazard Mitigation Strategies

One strategy for assisting boaters in the fog is to have a lighthouse with visual and audio signaling. Both Kewaunee and Algoma have operational lighthouses.

Kewaunee Lighthouse History

The Kewaunee Lighthouse represents the maritime heritage of the harbor while continuing to serve as a navigational beacon to Lake Michigan boating traffic. The property's period of historic significance begins in 1931 when it was established as a lighthouse and ends in 1959, the most recent year of its operation 50 years before the present.

The lighthouse personifies early twentieth century lighthouse architecture and engineering. It exemplifies design and construction methods used in building lighthouses and fog signal buildings on piers during that time period.

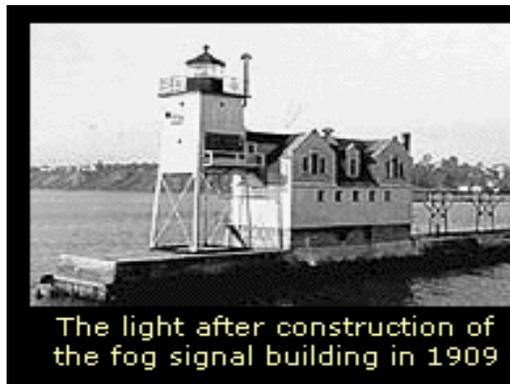

This structure possesses its original location, setting and design, and embodies historical qualities of integrity in materials, workmanship, feeling and association. The lighthouse lantern room houses a historic fifth order Fresnel lens with an electric light that is currently used by the USCG as a navigational aid. The character and appearance of Kewaunee Pierhead light are largely unchanged from when it was established as an aid to navigation.

Its existing structural integrity attests to the lasting value of its design, as well as the high quality of its materials and construction. Changes that have been made to the property include the 1931 addition of a light tower and lantern to a fog signal building built in 1909 in order to convert it into a lighthouse. Other changes include removing obsolete machinery when its fog signal was replaced, and removing an elevated walkway that provided access to the lighthouse prior to its automation. Despite these changes, the lighthouse's character and appearance remain essentially the same

as during its period of historical significance.

This structure's durable, efficient and weather-resistant character embodies the success of its design, high quality of construction, and appropriateness to this natural setting. The property's good state of preservation represents the permanence and durability of early 1900's pierhead lighthouses throughout the Great Lakes. Kewaunee Pierhead Light is widely regarded as a landmark in the Kewaunee County vicinity. It stands as an architectural and engineering monument to this locality's maritime and commercial history.⁹⁴

Algoma Lighthouse History

Ahnapee, an Indian name for "land of the great gray wolf" was a growing fishing town in 1871 when a fire swept from Green Bay, destroying thousands of acres of land. Local residents prepared for the worst by waiting beside boats on the lakefront with their

⁹⁴ <http://www.cityofkewaunee.org/kewaunee-pierhead-lighthouse.html>

valuables, planning on venturing out into the lake to avoid the approaching flames. Fortunately, torrential rains doused the fire at the last minute and saved the town.

Revitalized after their narrow escape, Ahnapee's city fathers began lobbying the federal government for funds to enlarge the town's harbor, which was home to a growing number of commercial fishing vessels. Responding with back-to-back \$25,000 appropriations in 1870 and 1871, the Army Corps of Engineers was dispatched to Ahnapee to construct improved protective piers and begin dredging the river mouth. As a direct result of these improvements, by 1879, Ahnapee's commercial fishing fleet had grown to become the largest on Lake Michigan and the town was formally renamed "Algoma," another Indian name meaning "park of flowers."

After pleas to the federal government for the erection of navigation aids at the harbor entrance went unheeded, local maritime interests took matters into their own hands, establishing and maintaining a couple of post lights at the outer ends of the piers. Finally realizing the need to provide official illumination at Ahnapee, Ninth District Engineer Major William Ludlow requested a surprisingly low appropriation of \$2,500 in his annual report for 1890 for the construction of a pair of range lights on the north pier. In order to keep the cost as low as possible, Ludlow's plans called for the erection of a simple post light at the outer end of the north pier and the erection of a taller timber framed beacon approximately 200 feet along the pier. Congress made the requested appropriation on March 3, 1891, however, with the Corps of Engineers in Algoma erecting new piers, work could not begin on the new ranges until completion of the piers in late 1892.

The new north pier on which the range was to be erected was of a unique design, being both split and offset at its midpoint. Since the ranges were to be located on the detached outer pier section, construction would necessarily begin with the erection of an elevated bridge across the gap to provide access to the outer pier. A contract for furnishing the prefabricated timber bridge was awarded to a ship builder in Manitowoc while work began on preparing the pier for the installation of the bridge components on their arrival. Since the pier would frequently be battered by waves over its surface, it was imperative that the new timber components be anchored securely to the piers. To this end, some of the stone within the pier cribs was removed, and 12" square timbers were bolted to the crossties within the cribs to serve as anchoring points for the bridge bents. On the arrival of the bridge components from

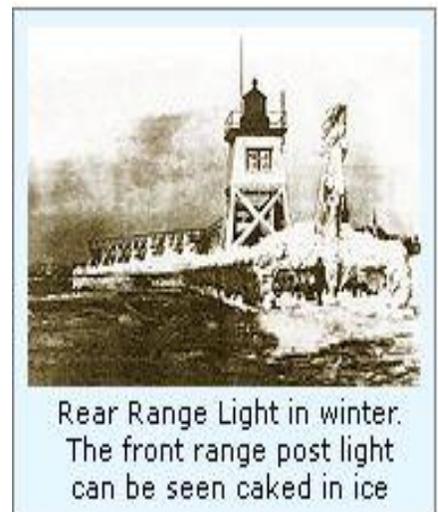

Manitowoc, the 10-foot tall bridge was erected across the gap, and work began on the erection of the lights themselves.

To form the Front Range, an eighteen-foot tall post was erected at the outer end of the pier and a lens lantern was placed atop the pole at a focal plane of 22 feet. Thirty-three yards behind the front range, the rear range light consisted of a typical timber framed skeletal pyramidal pierhead beacon with its upper section enclosed to serve as both a workroom and as shelter for the keeper during inclement weather. Capped with a square timber gallery, a cast iron decagonal lantern was centered on the gallery also containing a lens lantern similar to that installed on the Front Range. Standing 34 feet in height from the top of the pier to the ventilator ball, the 80-candlepower rear range light sat at a focal plane of 34 feet and was visible for a distance of nine miles at sea in clear weather. Work on the new lights continued into December with the lights finally being tested on December 23. With ice clogging the harbor, the decision was made to delay exhibition of the lights until the opening of the following navigation season.

Ole Hansen was appointed as keeper of the new lights and exhibited them for the first time on the evening of March 1, 1893. 1894 saw the erection of a small wooden oil storage shed on shore at the foot of the pier and the rear range light was upgraded to a Fifth Order Fresnel lens on June 5, 1895 with a resulting increase in its range of visibility to 11 miles. To make passage along the north pier safer during high seas, 400 feet of elevated walk was installed on the pier in 1897.

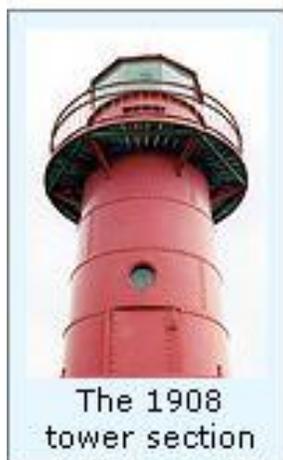

Photo courtesy of: U.S. Coast Guard
The original Lighthouse constructed in 1893.

Rear Range Light in winter.
The front range post light
can be seen caked in ice

An additional 338 feet was added to the elevated walk in 1900. In 1902 the Lighthouse Board requested that \$3,500 be appropriated for the construction of a dwelling at the station which unfortunately fell on deaf ears, as seen by the fact that Congress ignored the request despite the Boards restatement of the need for the appropriation in each of its annual reports for the following six years.

By 1907, the old wooden beacon was found to be in significantly deteriorated condition and while funds continued to be unavailable for a new dwelling, the old wooden beacon was demolished, and replaced by a cast iron cylindrical tower in 1908. Constructed of 5/16" steel plates, the tower was eight feet in diameter at the base and tapered to seven feet in diameter beneath the gallery and stood twenty-six feet high to the top of the ventilator ball. The new tower was capped by a decagonal cast iron lantern room, and outfitted with the Fifth Order Fresnel lens from the old rear range beacon.

Finally, sixteen years after the establishment of the station, an appropriation was made for the construction of a dwelling and a compact hip-roofed house was erected on the hill on the north side of the river overlooking the pier.

In order to render the light visible for a greater distance, a twelve-foot tall cylindrical steel base was brought in from Muskegon in 1932 and installed on the pier. The old 1908 tower was then lifted and secured on top of the cylinder, effectively increasing the tower's focal plane to its current forty-two feet. Also at this same time, a \$100,000 harbor improvement project was undertaken, which included capping both the North and South piers with concrete and the installation of remotely controlled electrically operated diaphone fog signal on the pier.⁹⁵

U.S. Coast Guard Navigation Aids

The U.S. Coast Guard marks the waters of the United States and its territories with the U.S. Aids to Navigation System. This system employs a simple arrangement of colors, shapes, numbers and light characteristics to mark navigable channels, waterways and obstructions adjacent to these. Aids to Navigation can provide a boater with the same type of information drivers get from street signs, stop signals, road barriers, detours and traffic lights. These aids may be anything from lighted structures, beacons, day markers, range lights, fog signals and landmarks to floating buoys. Each has a purpose and helps with determining location, getting from one place to another or staying out of danger. The goal of the U.S. Aids to Navigation System is to promote safe navigation on the waterway. An example of this system follows showing the proper display of navigation lights for a power-driven vessel less than 65.5 feet/20 meters in length.⁹⁶

⁹⁶ http://wow.uscgaux.info/Uploads_wow/1130-05-06/usaidthonavigationsystembooklet23dec03.pdf

The Coast Guard also offers boater safety classes, public informational materials and emergency rescue services for boaters.⁹⁷

The goal of fog mitigation activities is to reduce the loss of lives and property due to these events. There are few cases where infrastructure would be impacted by fog so there is little that the community can do to plan future buildings and infrastructure in a way that will mitigate these problems. Most mitigation measures will involve public information about the largest danger: automobile and boating crashes.

To help prevent automobile crashes, there are some signs along State Highway 42 warning of the potential rapid onset of fog.

Forest and Wildfires

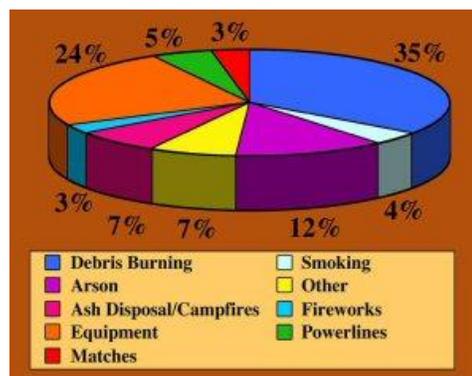

Wildfire (fires in forested, open, and/or agricultural land) season in Kewaunee County begins in March and continues through November, although fires can occur at any time during any month of the year. The fall season carries the highest risk of cropland fires (fields are stubble) while the spring season is riskiest for grassland fires (before new growth develops). Generally speaking, however, fires are more likely to occur whenever vegetation is dry as a result of a winter with little snow or a summer with sparse rainfall.

The Wisconsin Department of Natural Resources (DNR) is responsible for forest fire protection on approximately 18 million acres of forest and wild land in Wisconsin. The U.S. Forest Service maintains forest fire protection on two million acres of this land while local fire departments retain responsibility for the remaining wooded acreage.

Each town in Kewaunee County requires residents to apply for a permit prior to burning activities. Municipal ordinances for the Cities of Algoma and Kewaunee and the Village of Luxemburg can be found in the Previous Planning Efforts and Legal Basis section.

Physical Characteristics

The Wisconsin DNR has previously reported that approximately 1,500 fires annually that burn over 5,000 acres of the land that they protect; over 98% of these fires are human-caused. It should be noted that these figures do not include areas of the state where a local fire department has primary responsibility for service.

Frequency of Occurrence

While the total number of open fires in Wisconsin has decreased over the years, the potential danger to lives and property remains due to the increased encroachment of development into previously open lands. Overall, the probability for a forest fire in Kewaunee County is very low and the probability of a wildfire is very low. The probability of damage from forest or wildfire is also considered very low. There has been one state-wide wildfire event recorded since 1950 by the National Weather Service. This event occurred on 23 April 1994 and caused no injuries or deaths but did cause \$500,000 in crop and property damage (each).

Vulnerability

Forest and wildfires can impact the ecology of the open lands of Kewaunee County which exist primarily as wetlands along undeveloped lakeshore and as agricultural lands. A disruption to the area from fire could erase the usability of this habitat for wildlife and/or farming for many years.

In 2003, the National Association of State Foresters produced a Field Guidance for Identifying and Prioritizing Communities-at-Risk (CAR). The purpose of the guide was to provide states with a nationally consistent approach for assessing and displaying the risks to communities from wildfire. The DNR, in cooperation with its federal and tribal partners, began working on the statewide assessment of Communities-at-Risk in 2004.

Communities-at-Risk is a model to identify broad areas of the state that are at relatively high exposure to resource damage due to wildfire. Results of the model can then be used by local governments developing Community Wildfire Protection Plans (CWPP) and by the DNR to reduce local risks of wildland fire by prioritizing hazard mitigation and fire protection efforts.

The approach used in this risk assessment model is based on the "Methodology" section of the NASF Field Guidance document which recommends assessing and mapping four factors:

- Historic Fire Occurrence
- Hazard
- Values Protected
- Capabilities

Modifications to this methodology were made to fit the GIS mapping data layers available for Wisconsin. The Wisconsin DNR uses three factors to assess Communities-at-Risk to wildfire damage:

- Hazard – the relative likelihood that an ignited wildfire will achieve sufficient intensity to threaten life or property based on land cover type and historic fire regime.
- WUI (Values at Risk) – the relative vulnerability of each 2000 census block to wildfire damage based on housing density and spatial relationship with undeveloped vegetation based on housing density and proximity to vegetation (Wisconsin's Wildland-Urban Interface). Wisconsin's WUI was layered with a weighted vegetation layer to accentuate proximity to flammable vegetation.
- Ignition Risk – the relative likelihood of a wildfire ignition within a given 30-m pixel based on historic fire occurrence, population density and proximity to a potential ignition source.

Models were developed in GIS to create statewide grids representing each of the three weighted {Hazard (40%), WUI (30%) and Risk (30%)} inputs. This composite grid represents communities-at-risk (CAR) on a 0-9 scale of threat, with zero representing no threat and nine a very high threat. The data was then represented by municipal civil divisions (MCDs), which are city and village boundaries. Quantitative markers were assigned for five threat levels: very low, low, moderate, high, and very high and those MCD's determined to have a high or very high threat of wildfire were considered CARs. 337 communities met the requirements for being "at risk."

Communities in Wisconsin vary considerably in size. This is particularly evident in a north-south pattern, with larger more rural towns in northern Wisconsin and smaller, more urban towns in southern Wisconsin. Because of this variation in size, the potential for missing areas of high risk due to smoothing out by other parts of the town was greater for larger towns. For this reason, WI DNR incorporated a "Community of Concern" category to identify those towns that have portions of their town in high risk of wildfire but were not otherwise included as a Community-at-Risk. A Community of Concern was determined to be an area of at least two contiguous

square miles at high or very high risk; 237 communities were named as Communities of Concern.⁹⁸

As can be seen on the map in Appendix A, in Kewaunee County, no communities were identified as Communities at Risk or as Communities of Concern.⁹⁹

Because Kewaunee County has little forested area, there are no DNR Ranger Stations nearby. There are also no designated federal lands in Kewaunee County but there are several state and local natural areas including:

- **Kewaunee Nature Walk** (Kewaunee) – A 1,500-foot boardwalk path and observation deck over marshlands along the Kewaunee River where various waterfowl congregate.
- **Red River Park** (Hwy 57, Dyckesville) - This county park provides access to fishing and boating on Green Bay, private boat rentals, boat ramp, playground, picnic tables, grills, shelters and restrooms.
- **Little Scarboro Fishing and Wildlife Areas** (Luxemburg) - Scarboro Creek is a Class III trout stream stocked annually with brown trout. The Little Scarboro Fishing Area is open to the public and provides opportunities to catch stocked and native brook and brown trout. The Little Scarboro Wildlife area is open to public hunting for rabbit, grouse, pheasant, deer and squirrel.
- **Ahnapee State Trail** (Algoma to Sturgeon Bay) – This trail along the Ahnapee River is a 15.3-mile hiking, bicycling, horseback and snowmobile path that passes through meadows, rolling farmland and cedar glades teeming with wildlife. The railroad bridge has recently been replaced and the Kewaunee County portion of the trail has been newly resurfaced.

Along the lakeshores are undeveloped natural lands, including wetlands. Also, a large percentage of the county is open agricultural land which is susceptible to wildfire, especially in periods of drought.

⁹⁸ Wisconsin State Hazard Mitigation Plan, pp 4-74 through 4-77.

⁹⁹ <https://dnr.wi.gov/topic/forestFire/documents/communitiesAtRiskWildfire.pdf>

Hazard Mitigation Strategies

Government at all levels is developing mitigation programs in fire control and firefighting tactics with the goal of protecting lives and property from loss due to forest and wildfire. The Wisconsin Department of Natural Resources (DNR) does not have a forestry office in Kewaunee County and also does not pre-stage resources (e.g., rangers, equipment, supplies) there. If there was a large wildfire for which local firefighters would request state assistance, the DNR may be able to provide limited assistance based upon their deployment level at that time.

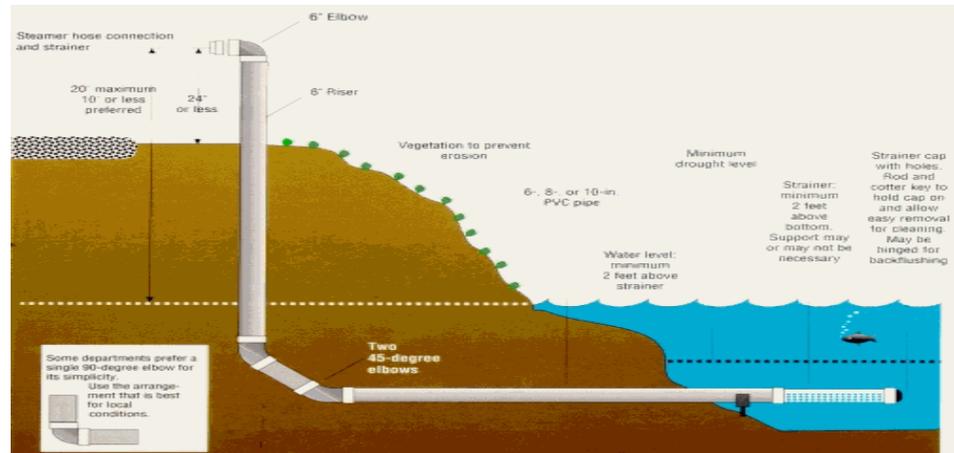

Locally, fire wardens are appointed to enforce burning regulations and restrictions based on the conditions of the area. Local fire departments attend regular trainings on fire-fighting tactics to keep their skills honed. The Kewaunee County Emergency Management Office assists local departments and their staff with available grant applications for training, exercising, equipment and planning as able and requested. The County Emergency Management Office and local fire departments, as part of their regular public-awareness campaigns, also use budgetary dollars to provide information to homeowners on protecting their homes and other buildings from wildfire and share information on fire safety and fire-resistant construction. This campaign often happens in conjunction with October's Annual Fire Safety Week.

There is no water storage that can be used for firefighting in the Town of Montpelier. This makes firefighting for structural and wildfires a difficult proposition. Currently mutual aid resources must be requested and used as ferries to move water to the scene. This is an inefficient use of resources and delays the effective and timely fighting of fires in the town. The Luxemburg Fire Department and the County Highway Department would like to apply for a grant to create a dry hydrant system; the estimated cost would be \$25,000.

A dry hydrant (see picture below) is a non-pressurized pipe system permanently installed in existing lakes, ponds and streams that provides a suction supply of water to a fire department tank truck. Dry hydrants have the following features:

- Use a non-pressurized pipe system.
- Use relatively inexpensive piping materials and other supplies.
- Are permanently installed in existing lakes, ponds, streams and cisterns.

- Provide a means of access whenever needed, regardless of weather.
- Allow years of simple operation with a minimum of maintenance.

When a dry hydrant is placed in a location with all-weather road access, it allows more water to be distributed in less time, the water can be applied effectively on the fire and fire fighter safety is improved. The following photos depict dry hydrant systems.¹⁰⁰

¹⁰⁰ <http://www.firehydrant.org/info/northstar.html>

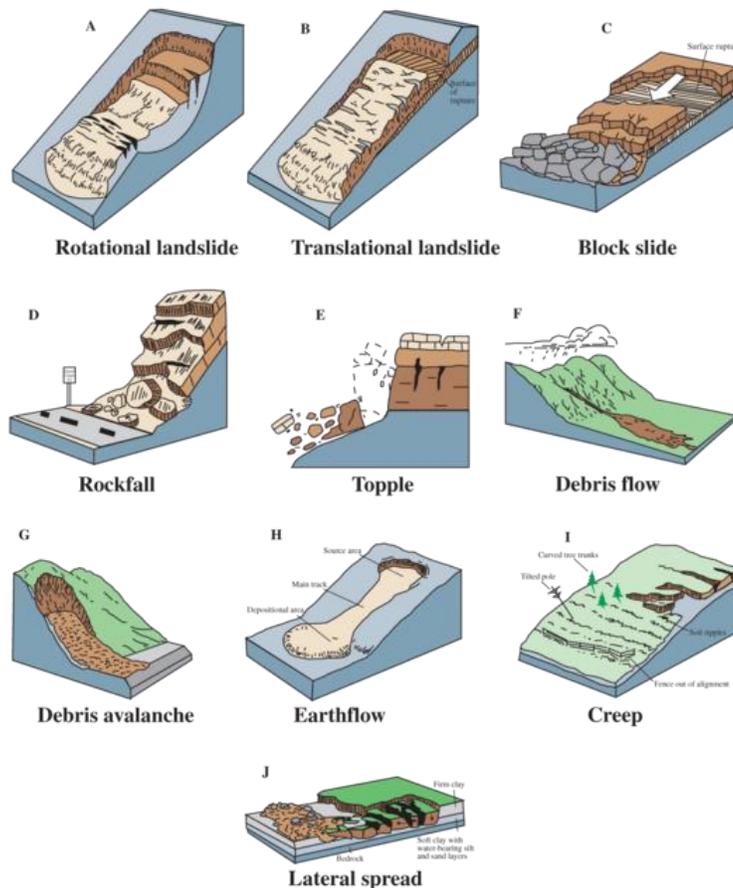

The hazard mitigation strategies listed above primarily involve providing information on general fire safety measures to the public for residential and commercial structures and providing ongoing training to the firefighters who fight these types of fires. These measures are designed to provide basic fire safety information with the hopes that implementation will protect property and, most importantly, lives. If a large fire does start, the pre-positioned equipment and continual, high-quality training should help to reduce losses to buildings and infrastructure within the county by providing an effective fire-fighting force.

Landslide

The term landslide includes a wide range of ground movement such as rock falls, deep failure of slopes and shallow debris flows. Although gravity acting on an over-steepened slope is the primary reason for a landslide, there may be other contributing factors. Factors likely to be seen in Kewaunee County include:

- erosion by rivers creating over-steepened slopes
- rock and soil slopes being weakened through saturation by snowmelt or heavy rains
- excess weight from the accumulation of rain or snow, stockpiles of rock or ore, waste piles or from man-made structures stressing weak slopes to failure ¹⁰¹

¹⁰¹ http://landslides.usgs.gov/html_files/nlic/page5.html and <https://editors.eol.org/eoearth/wiki/Landslide>

Physical Characteristics

Landslides may include any combination of natural rock, soil or artificial fill and are classified by the type of movement and the type of material. The types of movement are slides, flows, lateral spreads and falls and topples; a combination of two or more landslide movements is a complex movement:

- Slides: straight or rotating downward displacements along one or more failure surfaces of soil or rock as a single intact mass or a number of pieces
- Flows: a rapid, downhill mass movement of a “slurry” comprised of loose soil, rocks, organic matter, air and water
- Lateral spreads: large movements of rock, fine-grained soils or granular soils distributed laterally
- Falls and Topples: masses of rocks or material that rapidly detach from a steep slope or cliff that free-fall, roll or bounce.

Almost any steep or rugged terrain is susceptible to landslides under the right conditions. The most hazardous areas are steep slopes on ridges, hills and mountains; incised stream channels and slopes excavated for buildings and roads. Slide potentials are enhanced where slopes are destabilized by construction, heavy rainfall, floods or river erosion. Debris flows generally occur during intense rainfall on water saturated soil. Surface runoff channels along roadways and below culverts are common sites of debris flows.

Landslides often occur together with other major natural disasters thereby exacerbating relief and reconstruction efforts:

- Floods and landslides are closely related and both involve precipitation, runoff and ground saturation that may be the result of severe thunderstorms
- Landslides into a reservoir may indirectly compromise dam safety or a landslide may even affect the dam itself.
- Wildfires may remove vegetation from hillsides, significantly increasing runoff and landslide potential.

Landslide from fire damage in CO¹⁰²

Sinkholes can form naturally in areas with karst geology (i.e., areas with limestone or other bedrock that can be dissolved by water.) As the limestone rock under the soil dissolves over time from rainfall or flowing groundwater, a hollow area may form underground into which surface soil can sink. Sinkholes also can be caused by human activity such as collapsed, abandoned underground mines. Even though sinkholes have not been a factor in any natural disaster, identifying areas with karst conditions is important for not only public safety and protection of structures but because karst features provide direct conduits to groundwater. Areas with karst conditions are vulnerable to groundwater contaminants from pollutants entering a sinkhole, fissure or other karst feature.

Enlarged fracture in Brown County, WI¹⁰³

¹⁰² http://landslides.usgs.gov/html_files/landslides/slides/slide15.htm

¹⁰³ <http://www.uwex.edu/wgnhs/enlargedjoint.htm>

Frequency of Occurrence

According to the U.S. Geological Survey, landslides are a widespread geologic hazard, occurring in all 50 states where they cause on average \$1 to \$2 billion in damages and more than 25 fatalities annually. Landslides pose serious threats to highways; railroads and structures that support fisheries, tourism, timber harvesting, mining and energy production. Expanding urban development and other land uses have increased the incidence of landslide disasters in the United States.

Even though there have been no recent reports of landslide in Kewaunee County, Wisconsin Emergency Management has determined that Kewaunee County has a moderate susceptibility and a moderate incidence of landslide. The hazard exists primarily in the area along Lake Michigan and in the small northwestern portion of the county on the Bay of Green Bay (See the map in Appendix A.) Unfortunately, these are areas where development is occurring. This leads to a rating of a low likelihood of a landslide in the coastal areas and a low likelihood in the rest of the county. In the moderate belt, there is a low probability of damage due to a landslide.

The karst potential map in Appendix A shows that Kewaunee County primarily has deep karst features in the county but there are shallow karst features in small areas. The presence of this geologic feature supports the high probability of complications (e.g., sinkholes, fissures to groundwater) to residents. The good news is that the complications due to karst geology have a high probability of causing significant damage, injury or death.

Sinkhole in Monroe County, WI¹⁰⁴

¹⁰⁴ <http://www.uwex.edu/wgnhs/cavesink.htm>

Vulnerability

The most likely consequences of landslides in Kewaunee County is to erode road and structural foundations that were built on or near eroding coastal bluffs. There are a few private roads (e.g., driveways) or public access roads below the bluff structures; these could be temporarily blocked, restricting access to a few structures, due to debris that has fallen on them.

Cincinnati, Ohio¹⁰⁵

Karst geology, which has been identified in Kewaunee County, can lead to sinkholes under structures such as homes, businesses, roadways and railroads causing economic losses and possible injury to residents and the community. It is also important to note that a large portion of citizens in Kewaunee County rely on private well water systems that can be contaminated by hazardous materials finding direct paths through the karst features into groundwater supplies.

Hazard Mitigation Strategies

The goal of landslide mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to these events. Although the physical cause of many landslides cannot be removed, geologic investigations, good engineering practices and effective enforcement of land-use management regulations can reduce landslide hazards. Karst features should be considered in land use planning, stormwater management and hazardous materials planning to avoid possible damage to structures due to sinkholes or contamination of groundwater. Kewaunee County will continue to work with its municipal partners to ensure that areas at

¹⁰⁵ http://landslides.usgs.gov/html_files/landslides/slides/slide8.htm

Landslide

risk of landslide and karst-related complications are identified and mitigation strategies are employed as appropriate, especially when considering the placement of future buildings and infrastructure. The county will also continue to communicate the importance of well water testing.

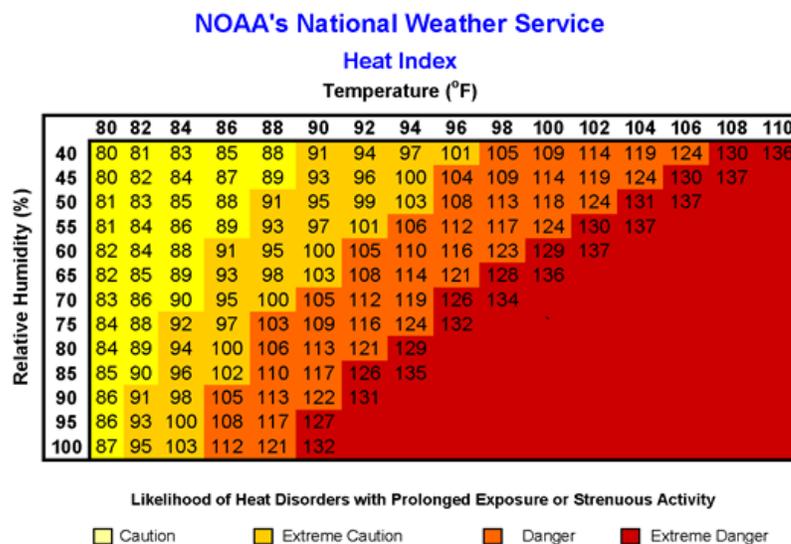

Severe Temperatures

Characteristics

Temperature extremes can cause disruption of normal activities for the population, property loss and even the loss of life, especially among the more vulnerable members of our population such as children and the elderly.

Physical Characteristics: Heat

Heat emergencies are a result of the combination of very high temperatures and very humid conditions.

The Heat Index estimates the relationship between these two conditions and reports them as a danger category, as can be seen in the following table.¹⁰⁶

Heat Index and Disorders Table			
Danger Category		Heat Disorders	Apparent Temperatures [°F]
IV	Extreme Danger	Heatstroke or sunstroke imminent.	>130
III	Danger	Sunstroke, heat cramps, or heat exhaustion likely; heat stroke	105-130

¹⁰⁶ FEMA, 1997; NWS, 1997

Severe Temperatures

		possible with prolonged exposure and physical activity.	
II	Extreme Caution	Sunstroke, heat cramps, and heat exhaustion possible with prolonged exposure and physical activity.	90-105
I	Caution	Fatigue possible with prolonged exposure and physical activity.	89-90

The major risks to people due to extreme heat are:

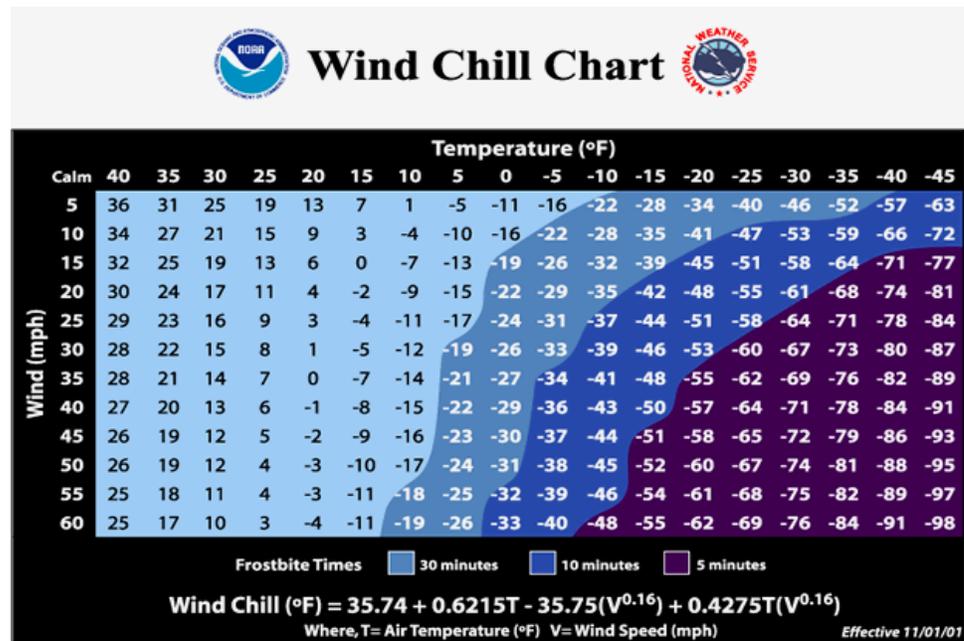

- Heatstroke – a potentially lethal medical emergency where the ability of the person to thermo-regulate is compromised resulting in the rise of the body’s core temperature to above 105 degrees Fahrenheit.
- Heat Exhaustion – a less threatening medical condition where the victim complains of dizziness, weakness and/or fatigue. The victim may have a normal or slightly elevated temperature and usually can be successfully treated with fluids.
- Heat Syncope – a sudden “faint” or loss of consciousness usually brought on by exercising in warmer weather than one is accustomed to; usually no lasting effect.
- Heat Cramps – muscular cramping brought on by exercising in warmer weather than one is accustomed to; no lasting effect.

Extreme heat conditions may also affect pets and livestock, decreasing agricultural output by the latter. Crops may also suffer reduced yield due to extremely hot conditions.

Physical Characteristics: Cold

Wind chill is a relationship between wind and cold that is based on the rate of heat loss from exposed skin. As the wind speed increases, heat is drawn from the body, driving down skin temperature and, eventually, body core temperature. The following table illustrates this relationship.¹⁰⁷

¹⁰⁷ <https://www.weather.gov/safety/cold-wind-chill-chart>

The major risks to people due to extreme cold are:

- Hypothermia – occurs when, due to exposure to cold, the body is unable to maintain its proper core temperature. It may occur in temperatures above freezing and may lead to death.
- Frostbite – describes local cooling, usually to an extremity, which occurs when exposure to cold air or liquid causes constriction of the blood vessels. There are three degrees of frostbite:
 - Frostnip – brought on by direct contact with a cold object or exposure to cold air or water. Tissue damage is minor and response to treatment is usually very good.
 - Superficial Frostbite – involves the skin and subcutaneous layers
 - Freezing – is deep frostbite in which the skin, subcutaneous layers and deeper structures (e.g., muscles, bone, deep blood vessels, organ membranes) of the body are affected and can become frozen.

Severe Temperatures

- Chilblains - lesions that occur from repeated/chronic exposure of bare skin to temperatures of 60 degrees Fahrenheit or lower.
- Trench foot – a condition that occurs when the lower extremities remain in cool water for a prolonged period of time.

Frequency of Occurrence: Heat

Wisconsin has been affected by several bouts of extreme heat including during the Dust Bowl period from 1934-1936. Other heat events occurred in 1979, 1995, 2001, 2011 and 2012.

Tables showing the excessive heat and heat events recorded by the National Weather Service in Kewaunee County ¹⁰⁸ can be found in Appendix B.

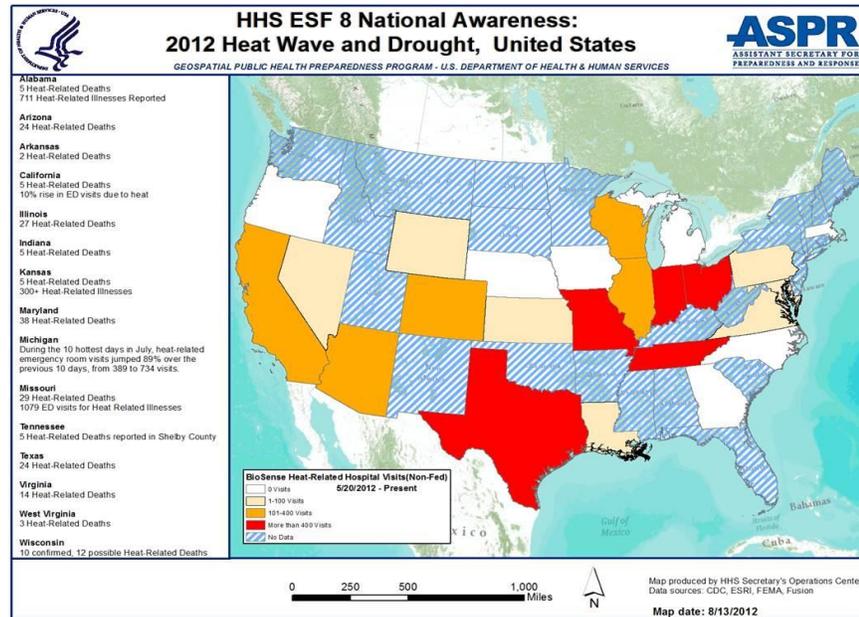

According to the State of Wisconsin Hazard Mitigation Plan, extreme heat is the number-one weather killer in Wisconsin with most of the heat deaths attributed to major heat waves. The workgroup felt that there was a low likelihood of occurrence in any given year and the severity of damages also has a low likelihood of probability.

It should be noted that during the summer of 2012 much of the country, including Kewaunee County, experienced a heat wave, resulting in significant droughts across more the half the country as well as increases in heat related illnesses and deaths. July was the hottest month in US history, eclipsing the record set during the heart of the Dust Bowl in 1936. The worst of the heat was in the Midwest, the Plains and along the Eastern Seaboard. Most of the contiguous US had record and near-record warmth for the seven-month period, except the Pacific Northwest, which was near average.

With the increase in heat-related illnesses comes an increase in emergency department (ED) admission across the country. Dehydration, heat exhaustion and heat stroke were the most common cause for patients' heat-related ED admissions. Most heat-related visits occurred in patients between the ages of 19 and

¹⁰⁸ <http://www.ncdc.noaa.gov/stormevents/choosedates.jsp?statefips=55%2CWISCONSIN>

70. In Wisconsin, there were ten confirmed and possibly 12 heat-related deaths.¹⁰⁹

According to the State of Wisconsin Hazard Mitigation Plan, extreme heat is the number-one weather killer in Wisconsin with most of the heat deaths attributed to major heat waves. As can be seen by the historical tables, Kewaunee County, like the rest of the state, is likely to experience extreme heat events every two to three years with extended, major heat waves occurring about every two decades. The workgroup therefore felt that there was a medium likelihood of occurrence in any given year. The committee also felt that the loss of property, primarily crop and livestock output has a medium likelihood of occurring in a drought year. The loss of life or injury to people has a medium likelihood of occurrence for the general population but the committee recognized that the likelihood increases for certain populations such as the elderly, chronically ill, children, those who work outdoors and those with limited financial resources (i.e., to pay for heating and air conditioning).

Frequency of Occurrence: Cold

¹⁰⁹ 2012 Heat & Drought Federal Report, HHS ESF 8, UPDATE #2, U.S. Department of Health and Human Services, Assistant Secretary for Preparedness and Response

Severe Temperatures

Wisconsin regularly has extreme cold temperatures as part of its winter climate. Tables that outline extreme cold/wind chill and cold/wind chill events which have been recorded by the National Weather Service in Kewaunee County¹¹⁰ can be found in Appendix B.

The data shows there are few years where a cold event does not occur in Kewaunee County and extreme cold happens once or twice, on average, per decade. After examining this data, the workgroup believed that cold and/or extreme cold has a medium likelihood of occurrence in any given year. Since there are no crops out during the winter and most properties (homes, businesses, barns) are insulated for this climate, the loss of property due to temperature extremes is not high although individuals may suffer damage due to water main breaks and other such problems. They further believed that the loss of life or injury to people has a medium likelihood of occurrence among the general population when there are cold/extreme cold weather events. Again, the workgroup recognized that people who work outdoors, who have limited financial resources, the elderly, the young and the chronically ill have a higher risk profile.

Vulnerability

There has been a trend toward higher temperatures that is expected to continue. As with drought, periods of high temperatures can cause decreased poultry and bovine production rates, which impact the economy of the community's large agricultural base.

More frequent and longer sub-zero stretches have been noted during the winter. These, coupled with concerns about utility failures, can disrupt agriculture, particularly with water supply disruption and with wind chill effects posing a risk to livestock and farmer health. Temperature extremes also pose significant problems for functional needs populations such as the elderly, the young, and the disabled. The primary general effects of extreme cold consist of water lines and mains freezing and breaking, disrupting water supply; shutting down of rural bus lines due to safety risks for children; and school closings, most often due to wind chill concerns.

Vulnerability to temperature extremes is generally assessed on an individual basis with the most vulnerable sections of our

^{49 & 110} <http://www.ncdc.noaa.gov/stormevents/choosedates.jsp?statefips=55%2CWISCONSIN>

community's population having the greatest risk. These people may include the elderly, the very young and the chronically ill. People from economically disadvantaged backgrounds, especially those listed in the categories above, are even more vulnerable since they are least able to afford the cost of adequate heating or air conditioning systems.

It should be noted that the propane shortage experience in, primarily, northern Wisconsin, in the winter of 2012-13 highlighted issues with utility reliability. The workgroup recognized that utility failures will exacerbate both the likelihood of occurrence and the severity of effects of extreme temperature incidents.

The Kewaunee County social services agencies are aware of many of these people who reside in our communities and they, along with the public health department, have plans and access to economic assistance programs to help these people in times of concern.

It is unlikely that infrastructure and buildings will be affected by either severe heat or cold. Buildings that are not well-designed or maintained for the Wisconsin climate may have affects such as water pipes bursting during extreme cold but this is unlikely for most buildings and infrastructure. The impact of losing these types of buildings may be problematic to the individuals who own and/or reside in these structures but it is not likely to be a community-wide problem; there are social support agencies that could work with impacted individuals to manage the effects of severe temperatures.

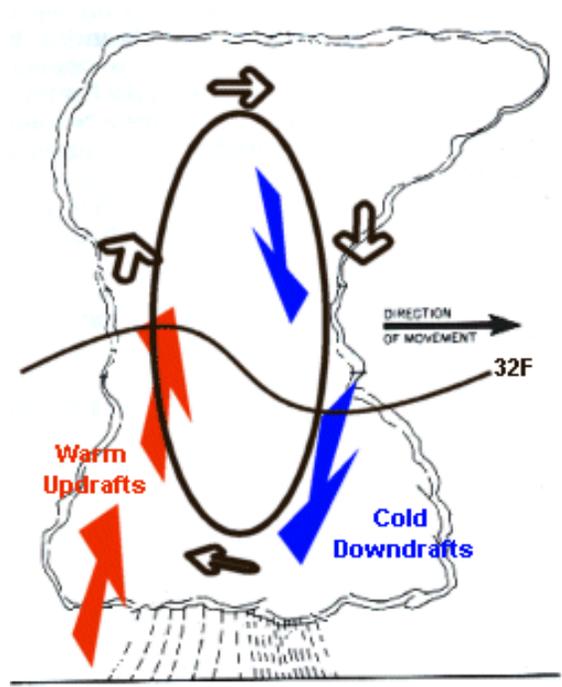

Hazard Mitigation Strategies

The goal of severe temperature mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to these events. Temperature extremes are difficult for a community to mitigate and the risks are to the health and safety of citizens, animals and crops. There are no strategies that need to be employed to reduce damages to buildings and infrastructure.

The Kewaunee County Emergency Management Office participates in the statewide public information campaigns for Winter and Heat Awareness Weeks each year and provides preparedness pamphlets and links to information on its website.

Storms: Hail

Studies of thunderstorms indicate that two conditions are required for hail to develop: sufficiently strong and persistent up-draft velocities and an accumulation of liquid water in a super-cooled state in the upper parts of the storm. Hailstones are formed as water vapor in the warm surface layer rises quickly into the cold upper atmosphere. The water vapor is frozen and begins to fall; as the water falls, it accumulates more water vapor. This cycle continues until there is too much weight for the updraft to support and the frozen water falls too quickly to the ground to melt along the way. The graphic below depicts hail formation:¹¹¹

Injury and loss of life are rarely associated with hailstorms, however extensive property damage is possible, especially to crops.

Physical Characteristics

Hail may be spherical, conical or irregular in shape and can range in size from barely visible in size to grapefruit-sized dimensions.

¹¹¹ Source: NWS, January 10, 2003

Hailstones equal to or larger than a penny are considered severe.¹¹²

Hail Size Estimates¹¹³	
Size	Inches in Diameter
Pea	1/4 inch
Marble/mothball	1/2 inch
Dime/Penny	3/4 inch
Nickel	7/8 inch
Quarter	1 inch
Ping-Pong Ball	1 1/2 inch
Golf Ball	1 3/4 inches
Tennis Ball	2 1/2 inches
Baseball	2 3/4 inches
Tea cup	3 inches
Grapefruit	4 inches
Softball	4 1/2 inches

Hail falls in swaths that can be from twenty to one hundred miles long and from five to thirty miles wide. A hail swath is not a large continuous path of hail but generally consists of a series of hail cells that are produced by individual thunderstorm clouds traveling in the same area.

Frequency of Occurrence

Hailstorms usually occur from May through August and Wisconsin averages two or three hail days per year. According to the Wisconsin State Hazard Mitigation Plan, from 1982 – 2012, Kewaunee County reported 15 hail events but fortunately none have led to loss of life and only two have led to injury. Kewaunee County averages 0.5 days of hail per year in most of the county with the far northwestern portion of the county averaging 0.5 – 1 days of hail per year (See the map in Appendix A). Based on these averages, Kewaunee County has a high probability of hail occurrence and as a result, the likelihood of damage due to hail is also considered high for damage to crops, roofs, and cars but low otherwise.

¹¹² NWS, January 10, 2003

¹¹³ NWS, January 10, 2003

Most hail damage occurs in rural areas because maturing crops are particularly susceptible to bruising and other damage caused by hailstones. The four months of hailstorm activity correspond to the growing and harvesting seasons for most crops. A table showing the hail events recorded by the National Weather Service in Kewaunee County¹¹⁴ can be found in Appendix B.

It should be noted that the table represents only the hail incidents reported to the National Weather Service. One limitation of the source data is that it showed no property or crop loss, death or injury while it is likely that there was some loss incurred.

After a careful review of the data by the workgroup, it was believed that there has been more accurate record-keeping and recording since the 1990s but that the table also shows an increasing frequency in the occurrence of hailstorms, with Kewaunee County having a hailstorm usually at least once per year. With that understanding, it was decided that the probability of hail is high.

Vulnerability

Hail, typically occurring in conjunction with thunderstorms and lightning, can damage many types of infrastructure. Public and private vehicles (e.g., campers, boats, cars, trucks) are liable to have their windshields cracked, bodies dented and paint damaged as a result of hail. This damage can occur, depending on the size of the hail, whether the vehicle is moving through the storm or is stationary. Hail on the roadway can also cause vehicles to slide off the road. Vehicle damage and iced roadways are of particular concern when you consider the need for emergency vehicles such as police cars, fire trucks and ambulances to quickly move to assist victims in a disaster.

Hail can also damage critical infrastructure such as street signs, electric lines/poles/transformers, telephone lines and radio communication equipment. These pieces of infrastructure are needed by both first response agencies and the general community to ensure safe transport; warm, safe homes and good internal and external communications abilities.

Residential and business properties are liable to receive damage to signs, siding, billboards, trees and windows. Manufactured housing

¹¹⁴ <http://www.ncdc.noaa.gov/stormevents/choosedates.jsp?statefips=55%2CWISCONSIN>

is particularly vulnerable to damage due to its lower construction standards.

Hail can be particularly damaging to agricultural concerns, damaging farm buildings, standing crops and livestock. As described previously, the agricultural sector is an important economic driver in Kewaunee County.

Hazard Mitigation Strategies

The goal of mitigating for hail is to reduce the amount of financial loss due to these events. Insurance is the most widely used adjustment for crop and property damages due to hail. Hail crop insurance is available from two sources: commercial stock and mutual companies; and the Federal Crop Insurance Corporation (FCIC). Farmers rarely purchase insurance coverage up to the full value of the losses that would result from a severe hailstorm. The Kewaunee County UW Extension Office distributes information on various hail insurance options.

In the event of major damage, a team composed of county and federal agricultural agency representatives and the county emergency management director have primary responsibility for assessing and documenting hail damage. Federal emergency assistance is available in the form of low-interest loans when a Presidential Disaster is declared or when the FmHA declares that a county is eligible for aid. Damage from hailstorms alone is generally not extensive enough to invoke a disaster declaration.

The Emergency Management Office also provides information to citizens for personal preparedness during spring severe weather awareness week and via its website and informational pamphlets distributed in public areas around the county on a regular basis.

The hazard mitigation strategies listed above primarily involve providing information on safety measures and insurance to the public for agricultural concerns and residential and commercial structures. These measures provide basic safety information but, since there is little one can do to prevent hail damage, these measures will do little to reduce damages to existing or future buildings and infrastructure, although the recommended insurance may make recovery easier.

Storms: Lightning

Lightning is a phenomenon associated with thunderstorms; the action of rising and descending air separates and builds-up positive and negative charge areas. When the built-up energy is discharged between the two areas, lightning is the result.

Formation of Lightning¹¹⁵

Lightning may travel from cloud to cloud, cloud to ground, or if there are high structures involved, from ground to cloud.

Physical Characteristics

The temperatures in a lightning stroke rise to 50,000°F (Fahrenheit). The sudden and violent discharge which occurs in the form of a lightning strike is over in one-millionth of a second.

Lightning damage occurs when humans and animals are electrocuted, fires are caused by a lightning stroke, materials are vaporized along the lightning path or sudden power surges cause damage to electrical or electronic equipment. Lightning, an underestimated hazard, kills more people in an average year than do hurricanes or tornadoes.

¹¹⁵ University Corporation for Atmospheric Research [UCAR]

Frequency of Occurrence

Nationwide, forty-five percent of the people killed by lightning have been outdoors, about sixteen percent were under trees, six percent were on heavy road equipment and thirty-three percent were at various unknown locations. Less than ten percent of the deaths involved individuals inside buildings; these deaths were primarily due to lightning-caused fires.

Wisconsin has a high frequency of property losses due to lightning. Insurance records show that annually one out of every fifty farms has been struck by lightning or had a fire which may have been caused by lightning. Generally, rural fires are more destructive than urban fires because of limited lightning protection devices, isolation, longer response times and inadequate water supplies. Kewaunee County has a high probability of lightning occurrence; the likelihood of damage due to lightning is considered low. This was determined by recognizing that while lightning usually happens in conjunction with thunderstorms, and that Wisconsin and Kewaunee County generally have several severe thunderstorms per summer, the specific location of a lightning strike is small when compared to the size of the county overall, which moderates its likelihood in any given location.

A table showing the lightning events recorded by the National Weather Service (NWS) in Kewaunee County¹¹⁶ can be found in Appendix B. This table from the NWS is obviously not reporting all of the incidents of lightning strikes but those with notable/reportable losses from the past and can reasonably be inferred to show that there is exposure to potential future losses.

Vulnerability

Lightning, which often occurs in conjunction with thunderstorms and hail, can damage many types of infrastructure such as electric lines/poles/transformers, telephone lines and radio communication equipment. These pieces of infrastructure are needed by both first response agencies and the general community to ensure safe transport; warm, safe homes and good internal and external communications abilities.

¹¹⁶ <http://www.ncdc.noaa.gov/stormevents/choosedates.jsp?statefips=55%2CWISCONSIN>

Residential and business properties are liable to receive damage either as a result of a lightning strike causing a fire or other type of direct damage or by overloading electronic equipment (e.g., computers, televisions) that have not been properly connected to a surge protector. This latter concern is especially important to business and government, which in modern America rely on computers and other electronic equipment to manage the large amounts of data manipulated in our information-based economy.

Lightning can damage agricultural assets including farm buildings, standing crops and livestock. It is also one of the major sources of ignition for forest and wildfires.

Hazard Mitigation Strategies

The goal of lightning mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to these events. The two primary ways to effectively reduce lightning losses are modifying human behavior and protecting structures (e.g., using fire resistant materials in building construction). The use of fire-resistant materials will make existing buildings and future construction less likely to catch fire or will minimize fire damage and spread due to lightning strike. Surge protectors limit data losses.

The Kewaunee County Emergency Management Office has awareness and educational materials in print and on the website that inform the public of safety procedures to follow during a lightning storm. The office also has materials available on fire-resistant construction methods and materials. Severe summer weather safety information is also emphasized during Tornado Awareness Week.

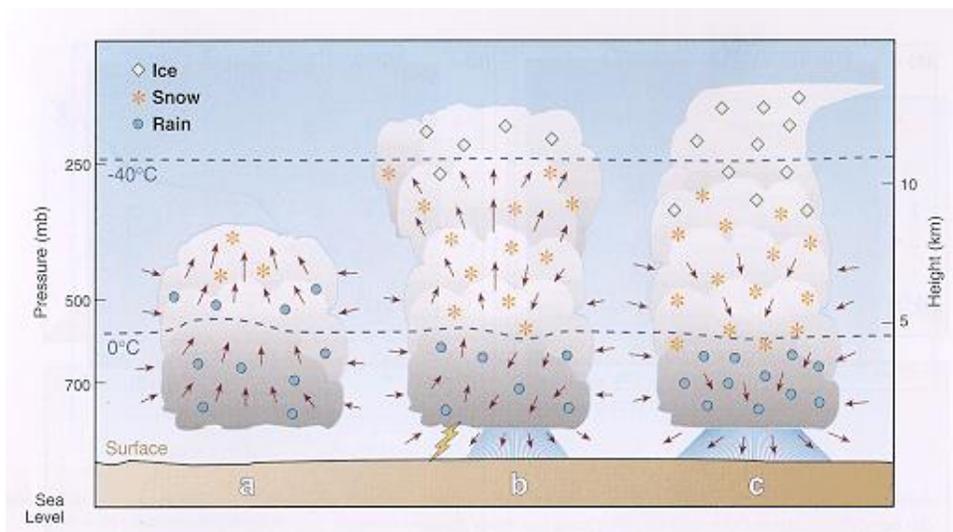

Storms: Thunderstorms

There are three distinct stages of development for thunderstorms (birth, growth, maturity) each of which can be seen in the following schematic. ¹¹⁷

In the first stage of development, an updraft drives warm air up beyond condensation levels where clouds form.

The second stage of development occurs as levels of water vapor in the expanding cloud rise past saturation and the air cools sufficiently to form solid and liquid particles of water. At this point, rain or snow begins to fall within the cloud.

A thunderstorm's mature stage is marked by a transition of wind direction within the storm cells. The prevailing updraft which initiated the cloud's growth is joined by a downdraft generated by precipitation. Lightning may occur soon after precipitation begins. Hail and tornadoes may also develop during this stage.

Physical Characteristics

A thunderstorm often is born, grows, reaches maturity and dies in a thirty-minute period. The individual thunderstorm cell often travels between thirty and fifty miles per hour. Strong frontal systems may

¹¹⁷ National Weather Service - Flagstaff

create one squall line after another, each composed of many individual thunderstorm cells. These fronts can often be tracked across the state from west to east with a constant cycle of birth, growth, maturity and death of individual thunderstorm cells.

Frequency of Occurrence

Thunderstorm frequency is measured as the number of days per year with one or more incidents. There are approximately 100,000 thunderstorms in the United States every year and approximately 10% of those are considered severe (i.e., has at least $\frac{3}{4}$ " hail, winds of at least 58 mph or a tornado). Most Wisconsin counties average between 30 and 40 thunderstorm days per year although a portion of southwestern and south-central Wisconsin average 40 to 50 thunderstorm days per year. In Kewaunee County there are typically several severe thunderstorms per year. Thunderstorms can occur throughout the year with the highest frequency during the months of May through September. The majority of storms occur between the hours of noon and midnight.

The probability of thunderstorms occurring in Kewaunee County is high as these storms usually occur one or more times each year during the summer in Wisconsin. Damage from thunderstorms usually is a result of the hail, lightning, winds and/or flash flooding that can occur as part of the storm. The likelihood of damage from these causes is discussed in the appropriate chapters.

Tables showing the thunderstorm events that have been recorded in Kewaunee County by the National Weather Service¹¹⁸ can be found in Appendix B

Vulnerability

Thunderstorms, which often produce hail and lightning and may occasionally spawn tornadoes, high wind storms or flash flooding, can damage many types of infrastructure. Kewaunee County's thunderstorm vulnerabilities due to associated hail, lightning, winds and flood waters are discussed in the other hazard chapters of this plan.

¹¹⁸ <http://www.ncdc.noaa.gov/stormevents/choosedates.jsp?statefips=55%2CWISCONSIN>

Hazard Mitigation Strategies

The goal of mitigating against thunderstorms is to save lives, preserve health and reduce property damage by employing the types of cost-effective measures discussed in this section.

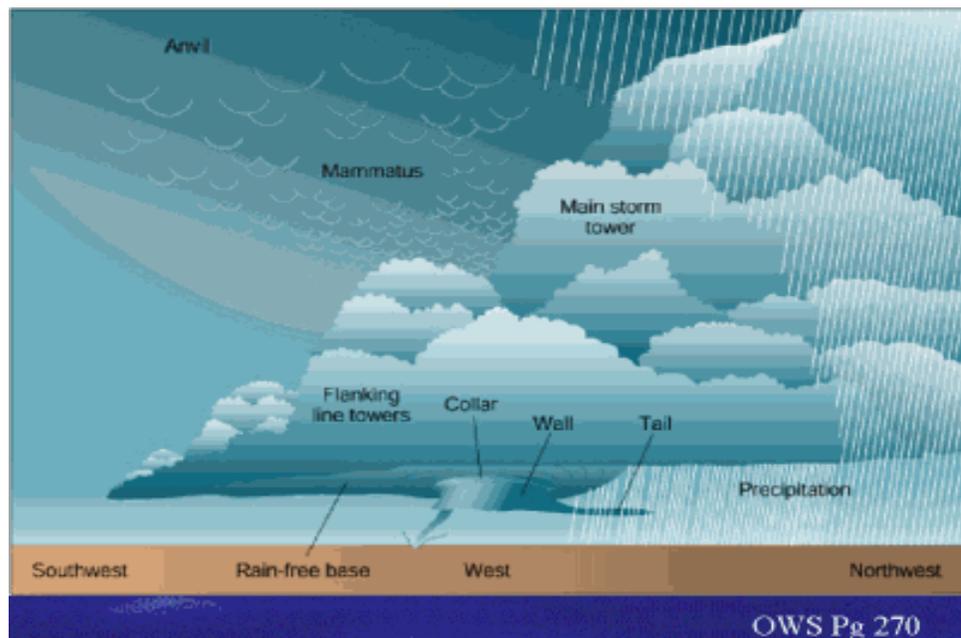

The Kewaunee County Emergency Management Office has prepared severe weather safety information that it disseminates to the public in the following manner:

- During Tornado Awareness Week, the media provides viewers with extensive coverage of storm safety tips and emergency procedures.
- The Kewaunee County Emergency Management Department assists the National Weather Service (NWS) with conducting tornado spotter training programs. Municipal first responders serve as the backbone of the spotter network in the county. At a Tornado Watch, municipal departments are paged and respond to areas within their communities to serve as spotters.
- Kewaunee County promotes early warning to the public. The county has current Emergency Alert System (EAS) hardware but lacks the money for installing the hardware and training the staff in the proper usage of it. A full discussion of this topic is in the Tornado chapter.

The damage to buildings and infrastructure in a thunderstorm is generally caused by components of the storm such as hail, flooding, lightning or wind. A discussion of strategies to reduce effects on existing and future buildings and infrastructure is discussed in the chapters that discuss each of these components in detail.

Storms: Tornadoes and High Winds

A tornado is a violently rotating, funnel-shaped column of air. The lower end of the column may or may not touch the ground. Average winds in the tornado are between 173 and 250 miles per hour but winds can exceed 300 miles per hour. It should also be noted that straight-line winds may reach the same speeds and achieve the same destructive force as a tornado.

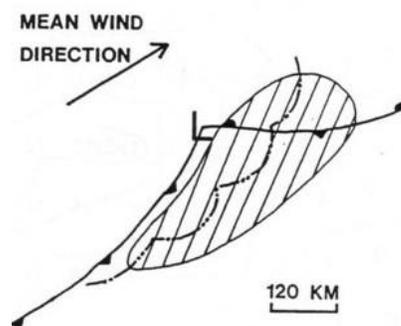

A derecho is a widespread, long-lived, violent, convectively-induced straight-line windstorm that is associated with a fast-moving band of severe thunderstorms usually taking the form of a bow echo. Derechos blow in the direction of movement of their associated storms; this is similar to a gust front except that the wind is sustained and generally increases in strength behind the "gust" front. A warm weather phenomenon, derechos occur mostly in summer, especially July, in the northern hemisphere. They can occur at any time of the year and occur as frequently at night as in the daylight hours.

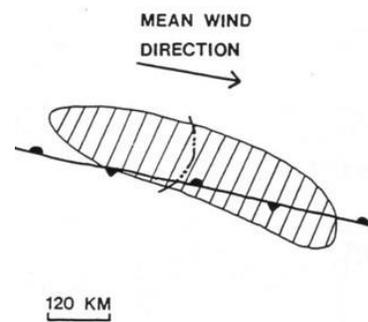

The traditional criteria that distinguish a derecho from a severe thunderstorm are *sustained* winds of 58 mph during the storm as opposed to gusts, high and/or rapidly increasing forward speed and geographic extent (typically 250 nautical miles in length). In addition, they have a distinctive appearance on radar (bow echo);

several unique features, such as the rear inflow notch and bookend vortex and usually manifest two or more downbursts. There are four types of derechos:¹¹⁹

- Serial: Multiple bow echoes embedded in a massive squall line typically around 250 miles long. This type of derecho is usually associated with a very deep low. Also because of embedded supercells, tornadoes can easily spin out of these types of derechos.
- Progressive: A small line of thunderstorms take the bow-shape and can travel for hundreds of miles.
- Hybrid: Has characteristics of a serial and progressive derechos. Hybrid derechos are associated with a deep low like serial derechos but are relatively small in size like progressive derechos.
- Low Dewpoint: Occurs in an environment of comparatively limited low-level moisture, with appreciable moisture confined to the mid-levels of the atmosphere.

Serial Derecho

Progressive Derecho

Physical Characteristics

Tornadoes are visible because low atmospheric pressure in the vortex leads to cooling of the air by expansion with condensation and formation of water droplets. They are also visible as a result of

¹¹⁹ <http://en.wikipedia.org/wiki/Derecho>

Storms: Tornadoes and High Winds

the airborne debris and dust in its high-winds. Wind and pressure differential are believed to account for ninety percent of tornado damage in most cases. Because tornadoes are associated with storm systems, they usually are accompanied by hail, torrential rain and intense lightning.

Tornadoes typically produce damage in an area that does not exceed one-fourth mile in width or sixteen miles in length. Tornadoes with track lengths greater than 150 miles have been reported although such tornadoes are rare.

Tornadoes damage severity is measured by the Fujita Tornado Scale, which assigns an “F” (“Fujita”) value from 0 – 5 to denote the wind speed.

The Fujita Tornado Scale ¹²⁰		
Category	Wind Speed	Description of Damage
F0	40-72 mph	Light damage. Some damage to chimneys; break branches off trees; push over shallow-rooted trees; damage to sign boards.
F1	73-112 mph	Moderate damage. The lower limit is the beginning of hurricane speed. Roof surfaces peeled off; mobile homes pushed off foundations or overturned; moving autos pushed off roads.
F2	113-157 mph	Considerable damage. Roofs torn off frame houses; mobile homes demolished; boxcars pushed over; large trees snapped or uprooted; light-object missiles generated.
F3	158-206 mph	Severe damage. Roofs and some walls torn off well-constructed houses; trains overturned; most trees in forest uprooted; cars lifted off ground and thrown.
F4	207-260 mph	Devastating damage. Well-constructed houses leveled; structures with weak foundations blown off; cars thrown and large missiles generated.
F5	261-318 mph	Incredible damage. Strong frame houses lifted off foundations and carried considerable distance to disintegrate; automobile-sized missiles fly through the air in excess of 100-yards; trees debarked.

On 1 February 2007, the National Weather Service began rating tornadoes using the EF-scale. It is considerably more complicated than the F-scale and it will allow surveyors to create more precise assessments of tornado severity. Below is a comparison between the Fujita Scale and the EF Scale:

Fujita Scale		Derived EF Scale		Operational EF Scale		
F Number	Fastest ¼ mile (mph)	3 Second Gust (mph)	EF Number	3 Second Gust (mph)	EF Number	3 Second Gust (mph)
0	40-72	45-78	0	65-85	0	65-85
1	73-112	79-117	1	86-109	1	86-110
2	113-157	118-161	2	110-137	2	111-135
3	158-207	162-209	3	138-167	3	136-165
4	208-260	210-261	4	168-199	4	166-200
5	261-318	262-317	5	200-234	5	Over 200

¹²⁰ FEMA, 1997

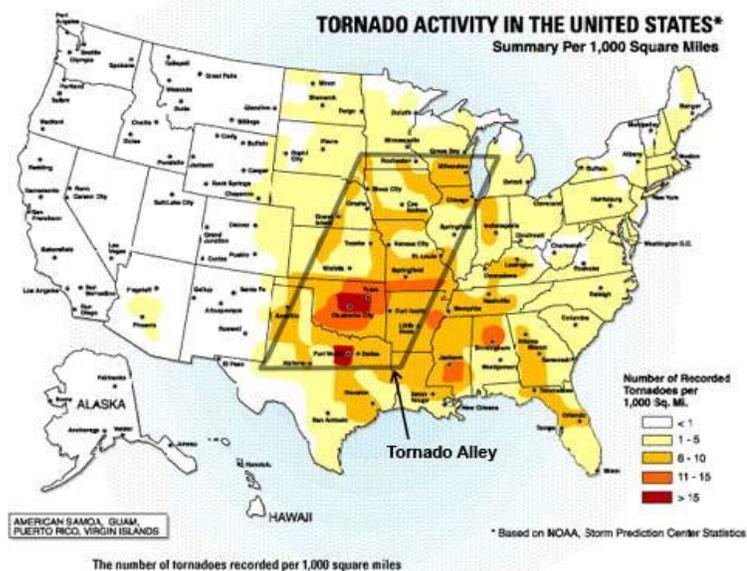

Downburst Characteristics

Downburst damage is often highly localized but resembles damage caused by a tornado. In some cases, even an experienced investigator cannot identify the nature of a storm without mapping the direction of the damaging winds over a large area. There are significant interactions between tornadoes and nearby downbursts.

A classic downburst example occurred on 4 July 1977 when a severe thunderstorm moved across Northern Wisconsin. Extensive areas of tree and property damage, somewhat like a tornado, were reported. After an aerial survey was completed to map both direction and F-scale intensity of the damaging winds it was determined that no evidence of a tornado was found anywhere within the path of the damage swath, which was 166 miles long and 17 miles wide. The survey revealed that there were scattered local centers from which straight-line winds diverged outward. These local wind systems were identified as downbursts with at least 25 specific locations recognized by the low-flying aircraft.

Frequency of Occurrence

Wisconsin lies along the northern edge of the nation's tornado belt, which extends northeastward from Oklahoma into Iowa and across to Michigan and Ohio. Winter, spring and fall tornadoes are more likely to occur in southern Wisconsin than in northern counties.

Storms: Tornadoes and High Winds

Wisconsin's tornado season runs from the beginning of April through September with the most severe tornadoes typically occurring in April, May and June. Tornadoes, have, however, occurred in Wisconsin during every month except February. Many tornadoes strike in late afternoon or early evening but they do occur at other times. Deaths, injuries and personal property damage have and will continue to occur in Wisconsin.

Tables showing the frequency of high winds, funnel clouds and tornadoes as reported by the National Weather Service can be found in Appendix B.¹²¹ The probability of Kewaunee County being struck by a tornado in the future is low and the likelihood of damage from future tornadoes is also medium. All parts of Kewaunee County are equally susceptible to tornadoes.

Vulnerability

Injury to people is a primary concern in tornado and high wind events. Two of the highest risk places are mobile home parks and campgrounds; Kewaunee County has several of each type of property. Both have high concentrations of people in a small area, generally have structures that provide less protection than standard construction homes and none of the listed facilities below provides storm shelters. Other places of interest in these types of events include critical emergency facilities such as hospitals and public works/highway garages, police stations and fire departments, which contain equipment and services needed by the public after a tornado.

Mobile Home Parks¹²²	
Park Name	Location
Lake Bluff	City of Kewaunee
Seventh Street Mobile Home Park	City of Algoma
Mueller Street Mobile Home Park	City of Algoma
Big Lake Estates, LLC	City of Algoma
Sunset Manufactured Homes	Village of Luxemburg
Lake Bluff	City of Kewaunee

Campgrounds ^{123 124 125}	
Campground Name	Location
Ahnapee River Trails Campground	Town of Ahnapee
Captain K's Marina and Campground	City of Algoma
Sunrise Cove	City of Algoma
Fisherman's Refuge, Inc.	City of Algoma
Cedar Valley Campground	Town of Casco
Kewaunee Village RV Park	City of Kewaunee
Mapleview Campsites	Town of Carlton
Timber Trail Campground	Town of Ahnapee

Schools, in addition to holding children, are the major type of structure used as community disaster shelters and their loss might therefore affect the community on several levels (e.g., the death or injury of children, the loss of a community housing shelter). School gymnasiums are often the specific location of the community shelter but they are especially vulnerable in tornadoes because the large-span roof structure is often not adequately supported.

Community infrastructure such as power lines, telephone lines, radio towers and street signs are often vulnerable to damage from tornadoes and high winds and can be expensive to replace. The loss of radio towers that hold public safety communications repeaters can adversely impact the ability of first responders to mount an effective response; damage to towers that hold public media equipment may adversely impact the ability to distribute adequate public information.

Residential property is likely to have siding and roofing materials removed, windows broken from flying debris and garages blown down due to light construction techniques. Perhaps one of the largest types of loss on private property is due to tree damage, which is generally not covered by federal disaster assistance.

Business properties are at risk for having damage to infrastructure such as signs, windows, siding and billboards. Agricultural buildings, such as barns and silos, are also generally not constructed in a manner that makes them wind resistant, which can

¹²³ http://www.wisconline.com/attractions/WI_campgroundsNE.html

¹²⁴ <http://www.cedarvalleycampground.com/>

¹²⁵ <http://www.visitkewaunee.com/stay/>

Storms: Tornadoes and High Winds

lead to the loss of livestock and harvest. Standing crops are also at risk from high winds and tornadoes.

The State of Wisconsin Hazard Mitigation Plan reports that in the 7 tornadoes experienced by Kewaunee County from 1950-2010, they had no deaths, six injuries and a total of just over \$500,000 in damages with an average of over \$78,000 per event. The planners estimated future annual losses at approximately \$9,016. (Note all amounts in 2008 dollars.)¹²⁶

Hazard Mitigation Strategies

The goal of tornado and high wind mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to these events. Kewaunee County has a history of damage to buildings and infrastructure due to tornadoes and high winds. Some strategies below will deal with public information and alert and notification while others will enable the community to make current and future buildings and infrastructure more disaster-resistant by enacting more “bricks and mortar” solutions.

An effective warning system is the single most important resource for alerting the public to a tornado hazard, which is critical to the main goal of saving lives and reducing property losses. Forecasting of tornadoes is difficult, however, because of the suddenness of their onset, their relatively short duration, the extreme variability of a tornado striking area, limited knowledge of tornado dynamics and the limitations of the weather observation system. The Emergency Management Office promotes the use of NOAA weather radios for public alert and notification especially in schools and other high-population facilities.

Local emergency notification procedures are in place for disseminating warnings and safety information using the outdoor sirens and the local radio station. Currently, outdoor sirens are activated at a Tornado Warning only. (Note: municipal first responders are not paged out to act as tornado spotters at a Tornado Watch but typically do this on their own). After the siren activation, a statement explaining actions to take due to the Tornado Warning are read at the radio station. An outdoor warning siren system consisting of 18 sirens currently reaches less than 50% of the population. Thirteen sirens are owned by the Kewaunee

¹²⁶ State of Wisconsin Hazard Mitigation Plan, pp. 3-50 through 3-56.

Nuclear Power Plant, two each are owned by the City of Algoma and the Village of Luxemburg and one is owned by the Village of Casco. The system is tested weekly during the entire year. The county, with the assistance of the nuclear power plants, invested in upgrading the siren computer system to include a capability to monitor the sirens and notify staff if repairs are needed or if there are security problems. The county and the plant are working together to complete another upgrade that will include placing a battery back-up on all of the sirens and expanding the system by five sirens, which will be placed outside of the Emergency Planning Zone (i.e., the 10-mile planning zone around a nuclear power plant.) The cost of these upgrades will be provided by the plant. The office also continues to evaluate various technologies to determine if they can be effectively integrated into the county's alert and notification systems.

During the past several years, there has been a statewide Tornado Awareness Week in late March or April. Media information packets are distributed to reemphasize and alert the public to tornado warning procedures. Kewaunee County actively promotes tornado safety public information as well as other summer severe weather public awareness and educational efforts. Kewaunee County also assists the National Weather Service with sponsoring tornado spotter training. Most of the tornado spotters in Kewaunee County are affiliated with municipal first response departments.

Kewaunee County Emergency Management assists personnel in schools and businesses, public facility managers and individuals with determining "best available" tornado safety areas. The Emergency Management Office also offers weather alert radios for purchase at a discount from retail costs.

The county recognizes mobile home parks and campgrounds are particularly vulnerable locations for people and property during a tornado. To help mitigate the danger, the county plans projects that include:

- Providing information via the website to builders and owners of manufactured and mobile homes regarding the use of tie-downs with ground anchors.
- Provide information to the municipalities regarding the tie-downs for mobile homes in the state regulations.
- Identifying and constructing tornado shelters in mobile home parks and campgrounds as grant funding is available. The U. S.

Storms: Tornadoes and High Winds

Department of Commerce Community Development Block Grants may be an avenue to achieve the necessary funding. If grant funding is not available, park owners will be encouraged to plan shelters on their properties.

- Ensure adequate coverage by outdoor warning sirens for campgrounds and mobile home parks. Some of the facilities are near sirens and should be able to hear them but others would need to have the power of the siren boosted or would need a new siren installed in the area. The County Emergency Management Office will work with vendors to determine needs and costs to ensure adequate coverage.

The City of Algoma would like to explore options for creating a storm shelter space for the residents of the Algoma Trailer Park. There is interest in a better sheltering option in the park's community. Options may include planning to open an existing space earlier, upgrade an existing space or build a new sheltering facility. It should be noted that some residents have functional needs.

The City of Kewaunee and the Village of Luxemburg would each like to explore options for sheltering trailer park residents at their parks. There are no shelters available near either trailer park and it might be difficult to get to the shelter quickly in a fast-moving storm.

Storms: Winter

Due to its position along the northern edge of the United States, Wisconsin, including Kewaunee County, is highly susceptible to a variety of winter weather storm phenomena.

Picture of snow drifts after the "Groundhog Day Blizzard" in 2011.

Physical Characteristics

The National Weather Service descriptions of winter storm elements are:

- Heavy snowfall - Accumulation of six or more inches of snow in a 12-hour period or eight or more inches in a 24-hour period.
- Blizzard - An occurrence of sustained wind speeds in excess of 35 miles per hour (mph) accompanied by heavy snowfall or large amounts of blowing or drifting snow.
- Ice storm - An occurrence when rain falls from warmer upper layers of the atmosphere to the colder ground, freezing upon contact with the ground and exposed objects near the ground.
- Freezing drizzle/freezing rain - Effect of drizzle or rain freezing upon impact on objects with a temperature of 32 degrees Fahrenheit or below.

- Sleet - Solid grains or pellets of ice formed by the freezing of raindrops or the refreezing of largely melted snowflakes. This ice does not cling to surfaces.
- Wind chill - An apparent temperature that describes the combined effect of wind and low air temperatures on exposed skin.

In Wisconsin, the winter storm season generally runs from November through March and Wisconsin residents are most familiar with heavy snowstorms, blizzards, sleet and ice storms. The majority of Wisconsin snowfalls are between one and three inches per occurrence, although heavy snowfalls that produce at least ten inches may occur four or five times per season. Northwestern Wisconsin encounters more blizzards than the southeastern portions of the state.

Damage from ice storms can occur when more than half of an inch of rain freezes on trees and utility wires, especially if the rain is accompanied by high winds. Another danger comes from an accumulation of frozen rain pellets on the ground during a sleet storm, which can make driving hazardous.

Frequency of Occurrence

Annual snowfall in Wisconsin varies between thirty inches in southern counties to one hundred inches in the north. Kewaunee County averages between 36 and 48 inches of annual mean snow depth in most of the county but a section of the county averages between 48 and 72 inches. Storm tracks originating in the southern Rockies or Plains states and that move northeastward produce the heaviest precipitation, usually six to twelve inches. Low-pressure systems originating in the northwest (Alberta) tend to produce only light snowfalls of two to four inches. Snowfalls associated with Alberta lows occur more frequently with colder weather.

Although massive blizzards are rare in Wisconsin, blizzard-like conditions often exist during heavy snowstorms when gusty winds cause blowing and drifting of snow. Near blizzard conditions existed in Wisconsin in February, 2011 when record snowfalls were recorded in many areas and very strong northeast winds were gusting from 45 to 60 mph for an extended period of time.

Both ice and sleet storms can occur at any time throughout the winter season from November to April. Ice storms of disastrous

proportions occurred in central Wisconsin in February 1922 and in southern Wisconsin in March 1976. A Presidential Disaster Declaration occurred as a result of the 1976 storm. Utility crews from surrounding states were called in to restore power, which was off for up to ten days in some areas. Other storms of lesser magnitude caused power outages and treacherous highway conditions.

Kewaunee County received a Presidential Emergency Declaration (FEMA-3163-DR-WI) for snow removal for the storm period December 11-31, 2000. Kewaunee was included in this declaration because they were contiguous to other counties with more extensive costs. The county did experience very heavy snowfall and blowing and drifting snow that affected safe travel on the roadways. There were no power outages associated with this storm and the major concern was providing timely emergency medical services to citizens. EMS districts worked with the highway department to ensure that equipment could get to emergency calls. The total cost of this disaster to Kewaunee County (including all municipalities) was \$61,936.16.

Winter storms in the county seem to be increasingly associated with ice instead of or in addition to snow, particularly early in the season. Recovery from ice events can be very expensive, with power line and other infrastructure repairs.

The probability that there will be severe winter storms in Kewaunee County is high and the likelihood that those storms will cause significant damage is medium. The tables of snow and ice events in Appendix B¹²⁷ show that there is little property damage but this does not take into account the public costs of managing the snow and ice as well as the costs of managing utility repair to power, telephone and water lines.

Vulnerability

Winter storms present a serious threat to the health and safety of affected citizens and can result in significant damage to property. Heavy snow or accumulated ice can cause the structural collapse of homes, commercial buildings and agricultural structures; down power lines or isolate people from assistance or services by

¹²⁷ <http://www.ncdc.noaa.gov/stormevents/choosedates.jsp?statefips=55%2CWISCONSIN>

impeding transportation by the general public, emergency responders and public transportation resources.

The loss of electrical service and/or the blocking of transportation routes can adversely affect the ability of commercial enterprises to conduct business. This economic injury can affect both the business owner and employees unable to work during this period.

Hazard Mitigation Strategies

The goal of winter storm mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to these events.

Communities prepare for severe winter weather by ensuring that plowing and sanding equipment is operational and available to handle potential emergencies. Funding is budgeted for the overtime hours of extra personnel but in a large emergency this may not be adequate. Redundant communication modes (e.g., radio, telephone) exist between government, police, fire, EMS, hospitals and highway departments. The Kewaunee County Emergency Operations Plan provides for coordination of public safety support agencies such as the American Red Cross and for resource acquisitions during winter emergencies.

Winter safety information is prepared and distributed to the media and the public by the Kewaunee County Emergency Management Office during Winter Awareness Week in November. Preparedness information is also available from display racks in the emergency management office and from the website. During a storm, the public is advised to monitor local radio, television and NOAA weather alert radios for up-to-date forecasts.

The County Highway Department also has within its annual operating budget funds designated to deploy wooden lattice snow fencing along state and county roads. This fencing blocks the blowing and drifting of snow on the roadways.

The hazard mitigation strategies listed above primarily involve providing information on general safety measures to the public. These measures provide basic safety information but, since the response to winter storms is primarily a government and/or corporate function comprised of tasks such as clearing roads of snow and ice and repairing downed utility lines, there are few

measures that can be employed to reduce damages to existing or future buildings and infrastructure.

Utility Failure

A utility emergency is a disruption to the building services, usually defined as electrical power, water, natural gas and/or sewage that restricts the ability of people to safely occupy the facility. Electrical power or natural gas outages are often caused by a fuel shortage caused by an oil embargo, power failure or natural disaster. Disruptions to the water and sewage systems are often the direct result of a natural disaster (e.g., flooding) or are indirect losses due to another failure (e.g., a power outage disrupts the pumping of water and/or sewage).

Physical Characteristics

Modern society is very dependent on electrical power for normal living and is therefore quite disrupted by loss of power. Most power outages last from about fifteen minutes to one hour. If longer, the utilities will inform the local news media of the anticipated duration of the outage.

Thunderstorms with lightning are a possible cause of power failure. Fuel shortages can be caused by localized imbalances in supply. Labor strikes, severe cold weather or snowstorms also can cause a local shortage.

Utility providers to Kewaunee County include:

- Electricity: Wisconsin Public Service (WPS) and Algoma Utilities (City of Algoma)
- Natural Gas: WPS
- Telephone: AT&T and CenturyTel (Casco)
- Cable Television: Charter
- Water/Sewer: a large percentage of the county's residents, primarily those in the more rural townships, rely on individual wells and septic systems for service. Many municipalities provide services in the cities and villages including the Cities of Algoma and Kewaunee, and Villages of Casco and Luxemburg.

Electrical substation

The water and sewage systems are most often a function of a municipal system and are usually found in more urbanized areas. Rural water is often provided by individual wells found on each property and sewage is managed by a septic system, also found on each individual property. Both municipal and individual systems are vulnerable to flooding, which can overwhelm the sewage systems and contaminate both municipal and private wells. Both types of systems are also vulnerable to electrical power loss because the electrical system powers the pumps and lift stations that move and treat the water and sewage.

Frequency of Occurrence

Kewaunee County has approximately 6-10 short power outages (i.e., lasting less than six hours) per year but does not have a history of extended power outages although the possibility always exists that a man-made or natural disaster could affect the power system for an extended period of time. Due to the mostly rural nature of Kewaunee County, brown-outs (i.e., times when, because of high power demand, areas are purposefully turned off of the power grid) are not a strategy used by the power companies that provide service.

In general, Kewaunee County has a low likelihood of utility loss with a high risk of damage, death or injury due to a loss. Obviously, power outages are more likely to occur and the severity is greater in areas of higher human population (i.e., urban areas) but the loss

Utility Failure

of power to rural customers, while affecting fewer people, generally lasts longer and can be as life-threatening, especially if a person with special needs (e.g., the elderly, the young, those on special medical equipment) is involved.

Vulnerability

The failure of a utility to function can have wide-ranging impact in Kewaunee County. People, especially special needs populations, in residential properties may not be able to safely live in their homes because of inadequate heat, the inability to cook, etc. Most schools and both of the nursing homes in Kewaunee County have emergency power generators for their facilities. Businesses, including the utilities themselves, may lose money due to the inability to produce goods and services for which they can bill and they may be non-operational due to damaged infrastructure, which can be very expensive to replace and/or repair. Critical infrastructure such as hospitals, schools and governmental facilities may not be able to operate or may have to operate at a reduced capacity due to the loss of utility services. EPCRA facilities may not be able to adequately control and contain their chemicals and there may be a release of hazardous materials that can impact people or the environment.

Agricultural assets may be impacted by the loss of utilities because extreme temperatures reduce the volume of livestock products and products such as milk may not be able to be properly stored. Modern farms also require on a large amount of automation for feeding, watering and managing the wastes of the facility.

Finally, transportation on roadways may become unsafe due to the loss of directional and street lights.

It should be noted that the Kewaunee Nuclear Power Station is within the county's boundaries and the Point Beach Nuclear Power Plant is just over the southern border of the county (i.e., in Manitowoc County.) The Kewaunee Power Station ceased operation (i.e., generating electricity) on 7 May 2013 but still maintains spent fuel on-site. The Point Beach plant provides up to 20% of the power used in the State of Wisconsin. There are several large transmission lines that take the power from the generating station to the rest of the electrical power grid, many of which originate or run through Kewaunee County. The loss of

these lines could seriously impact the delivery of electrical power to other citizens in Wisconsin. There is also a natural gas pipeline that runs to Casco and Luxemburg by County Road S.

Hazard Mitigation Strategies

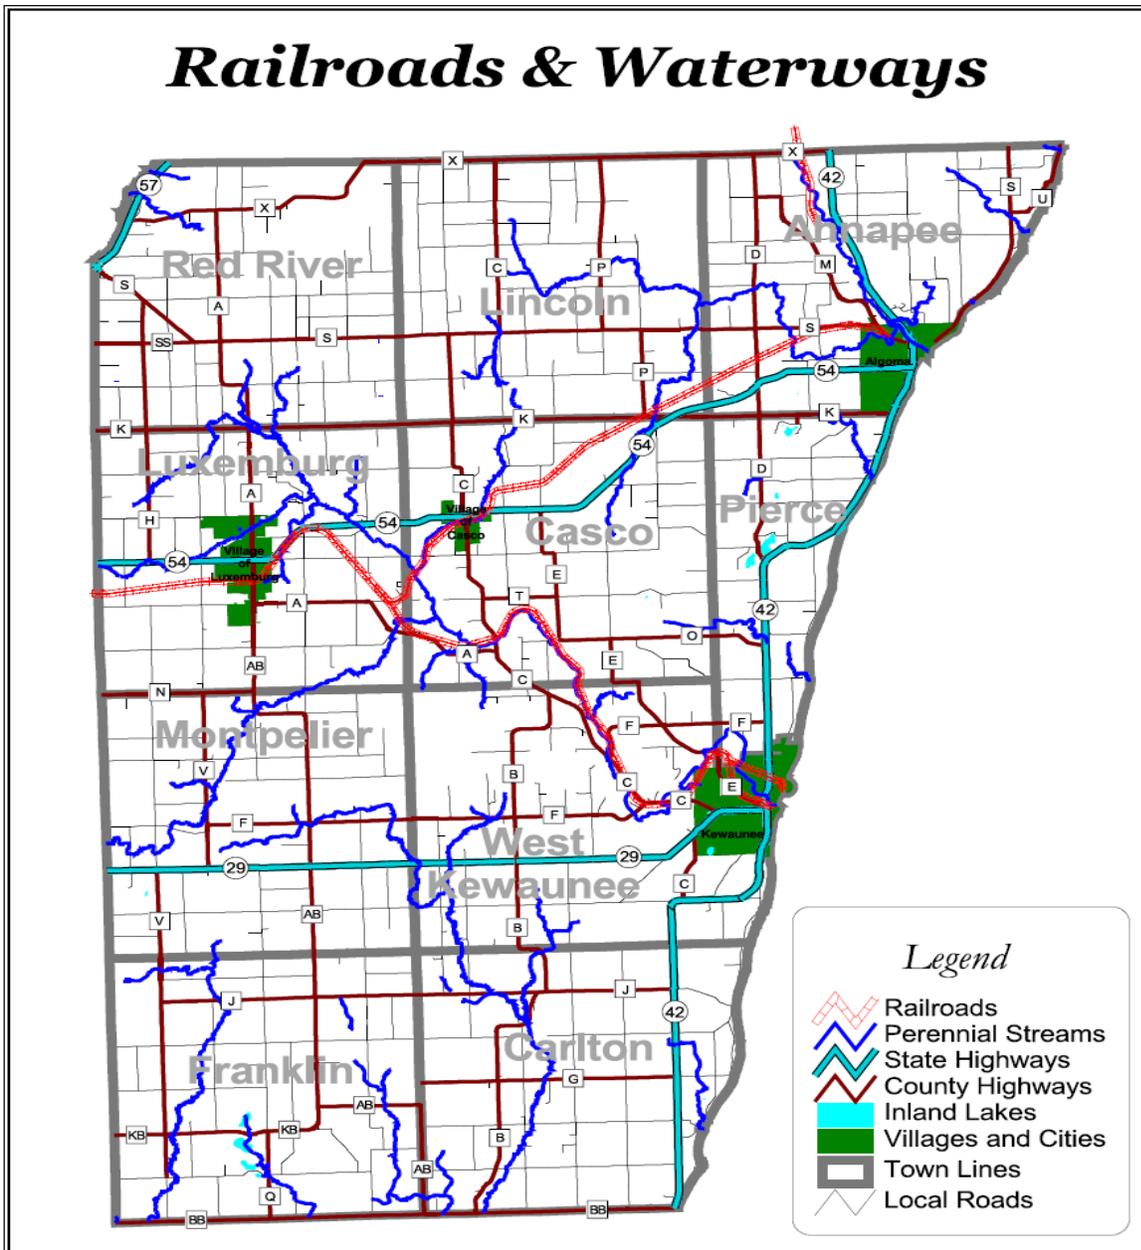

The goal of utility failure mitigation activities is to reduce, in a cost-effective manner, the loss of lives and property due to these events. There is a long and strong relationship with the electrical power companies due in part to the presence of the nuclear power plants. The county does not have as strong a relationship with the natural gas pipeline owners and would like to open dialog with the company so they become a partner in the emergency planning process. This project would be led by the Emergency Management Office and any costs would be covered by the department budget. Kewaunee County would also like to explore preparedness (planning, training, exercising) options concerning the high-pressure water line running from Green Bay to Lake Michigan. There is a concern that a rupture could affect the entire underground area around buried pipe.

During a fuel or power shortage, residents, schools, industry and businesses will be asked to take measures to conserve fuel. If the fuel shortage reaches the critical stage, all non-essential facilities will be closed down and contingency plans will be put into effect.

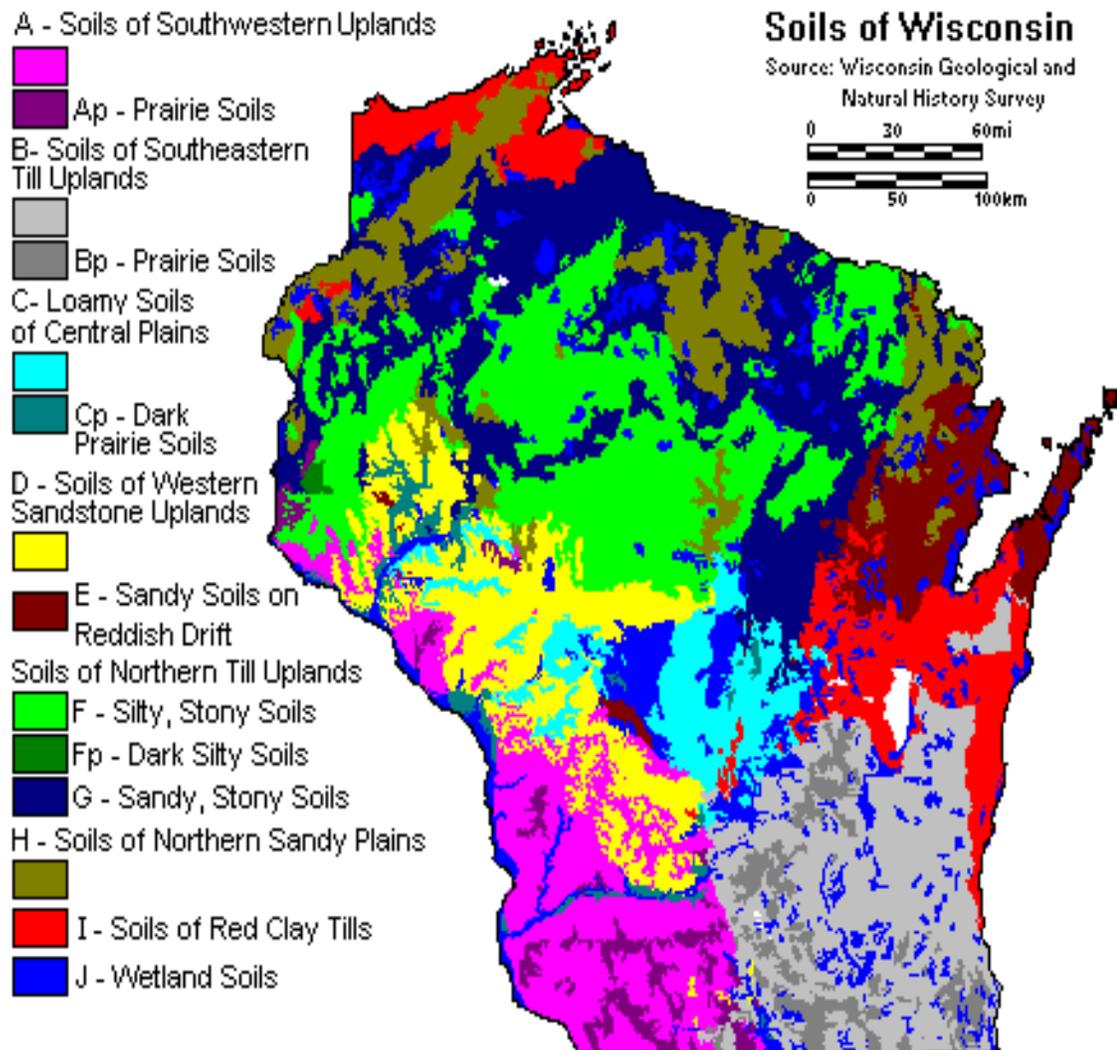

In the event of a prolonged power outage, Kewaunee County has generators available to provide power for radio communication and EOC operation. Also, evacuation and shelter arrangements have been prepared in case of a severe power outage.

Wildfire Communities-at-Risk¹⁴⁹

Introduction to Communities-at-Risk

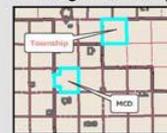

The purpose of this model is to identify broad areas of the state that are at relatively high exposure to resource damage due to wildfire.

As mandated by the NASF, Wisconsin's Communities-At-Risk are divided into three categories:

- 1) Very High
- 2) High
- 3) Community of Concern*

* A Community of Concern is a Wisconsin DNR concept whereby it is demonstrated that a significant portion of the community (more than 2 adjoining square miles) are at high or very high risk, but where the community as a whole falls below the Community-at-Risk threshold.

Defining Community

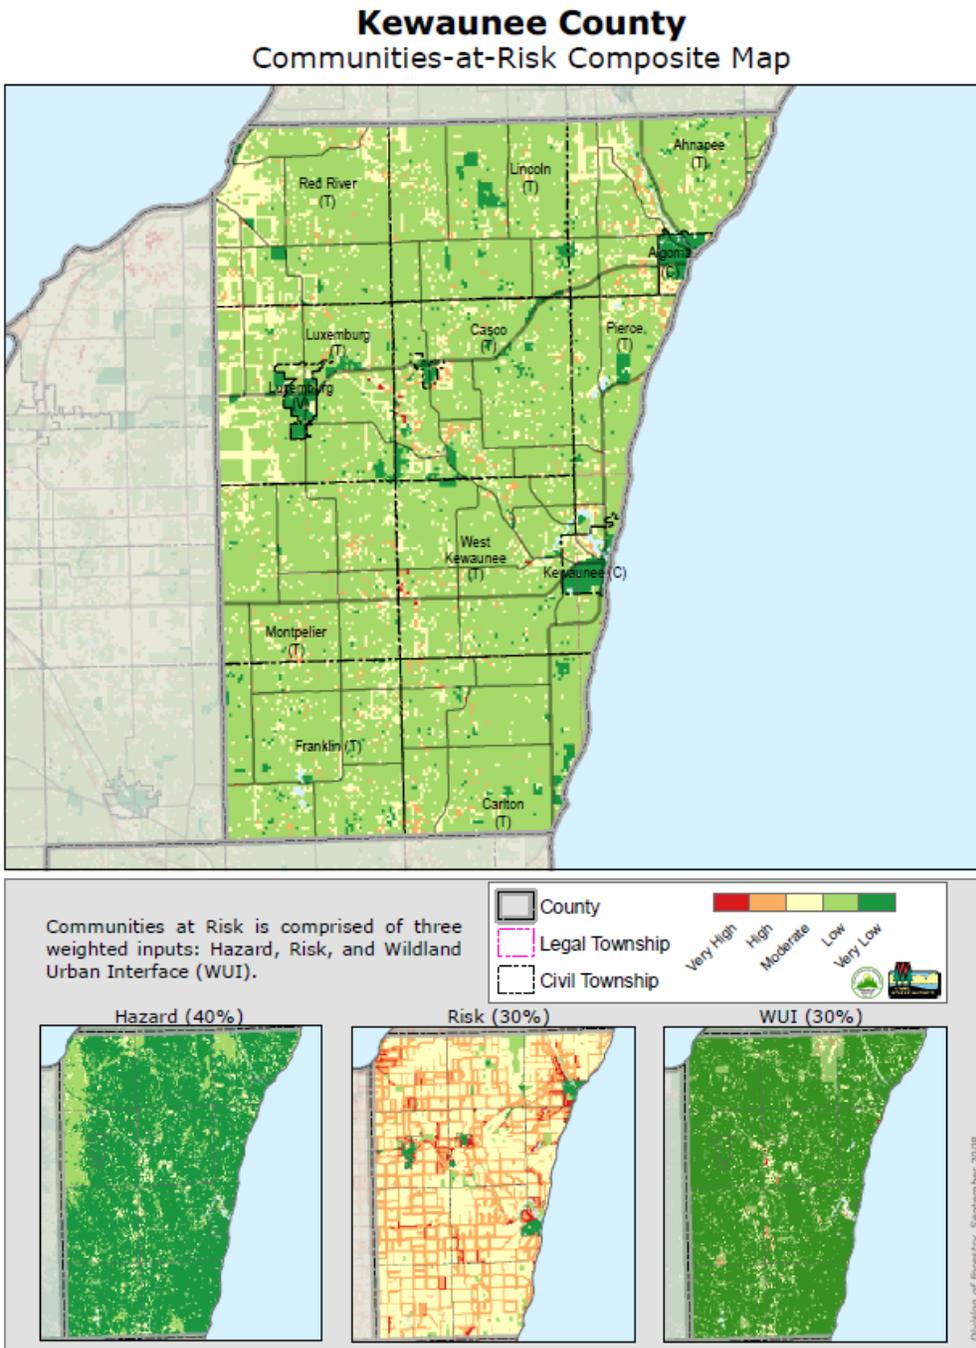

For Wisconsin, Communities-at-Risk are reported at the MCD (municipal civil division) level*. MCD was chosen due to its identifiable legal boundaries, ease in reporting, and usage in the development of Community Wildfire Protection Plans.

* Menominee County is an exception due to its lack of MCD's (civil townships). Therefore, Menominee county is reported by legal township.

Wisconsin Hail Events

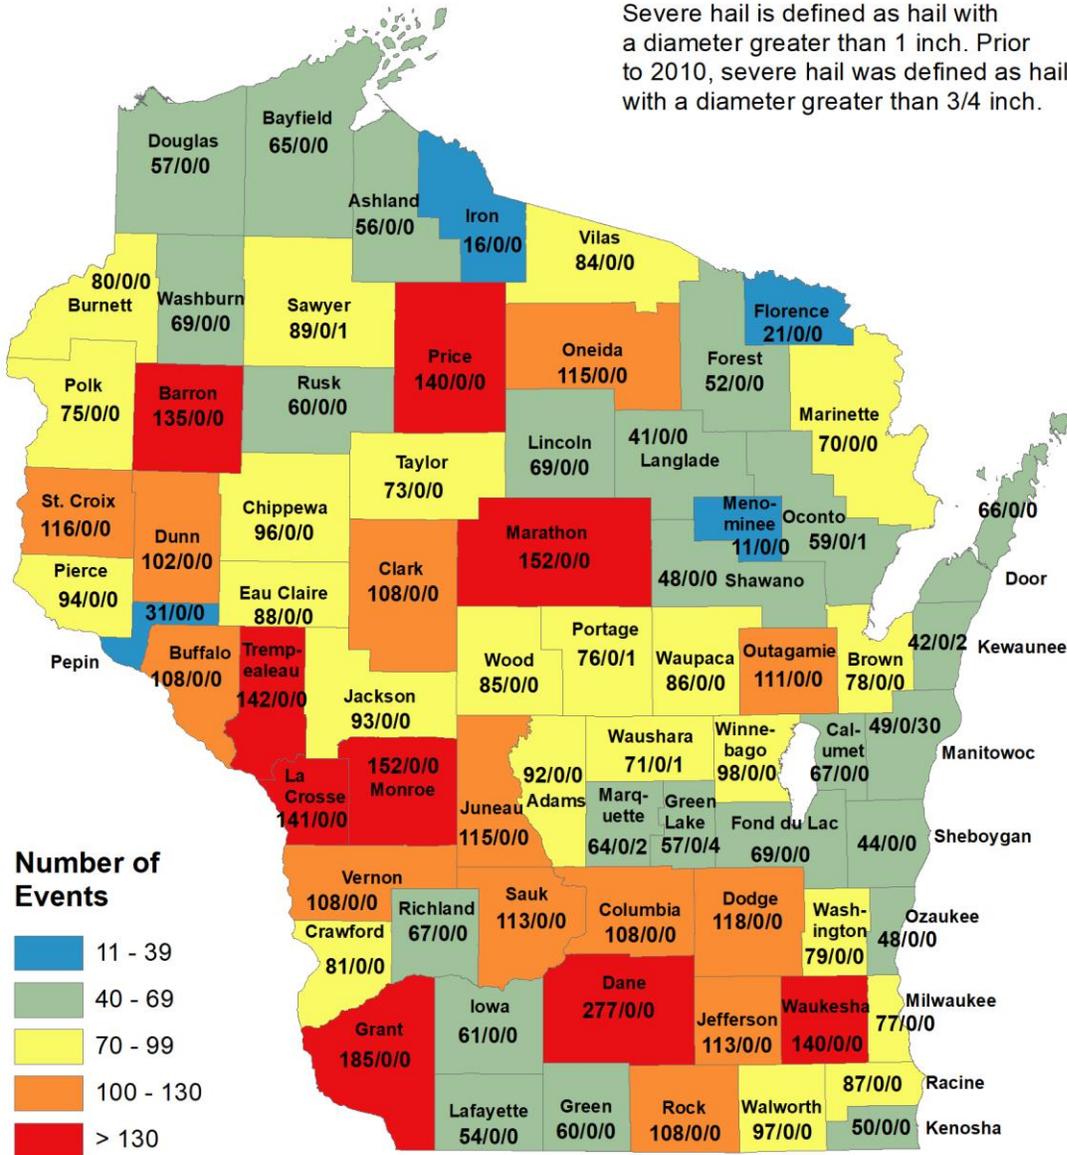

Wisconsin Severe Hail Events

1982 - 2018

Events / # Deaths / # Injuries

Severe hail is defined as hail with a diameter greater than 1 inch. Prior to 2010, severe hail was defined as hail with a diameter greater than 3/4 inch.

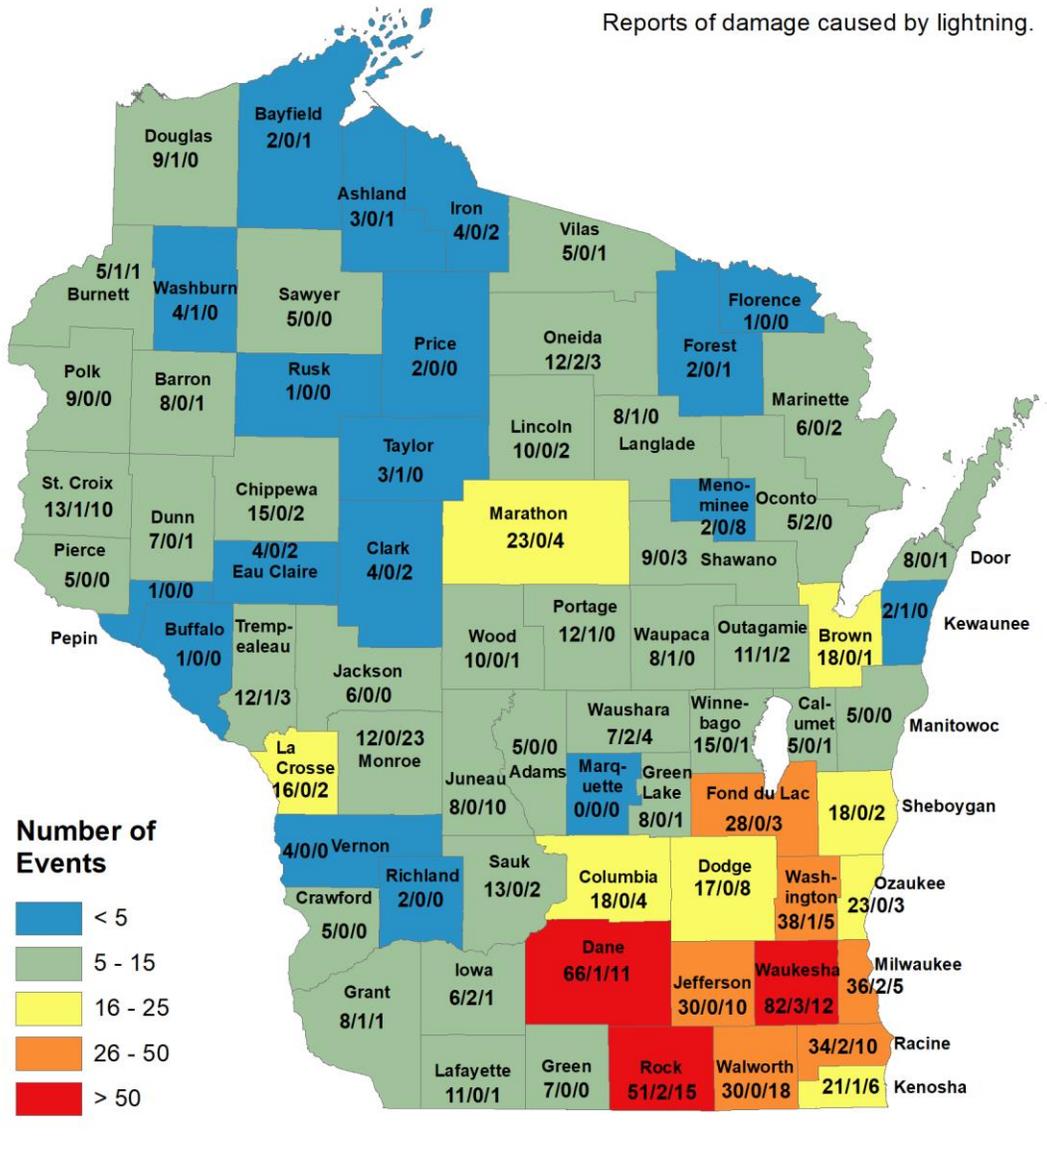

Wisconsin Lightning Events

Wisconsin Lightning Events 1982 - 2018 # Events / # Deaths / # Injuries

Reports of damage caused by lightning.

Wisconsin Severe Thunderstorm Winds

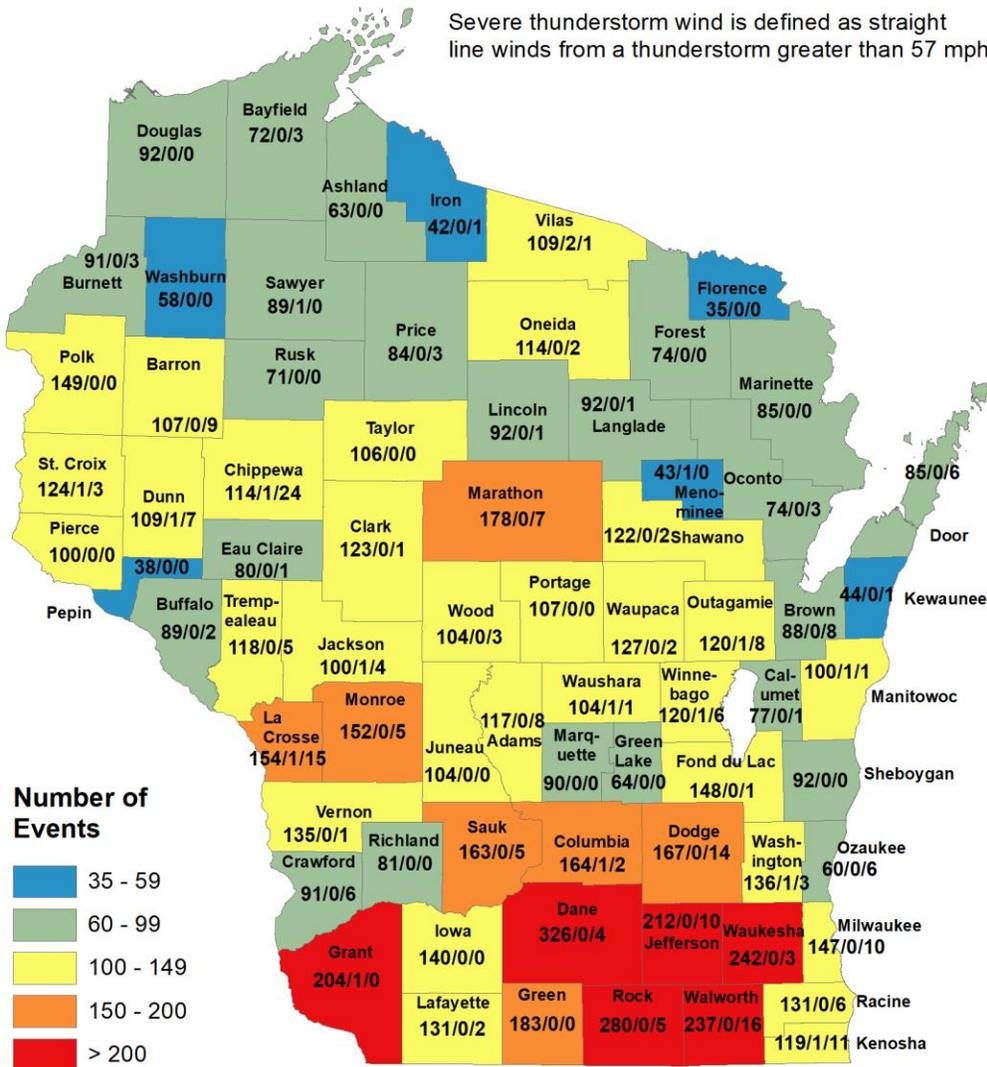

Wisconsin Severe Thunderstorm Wind Events

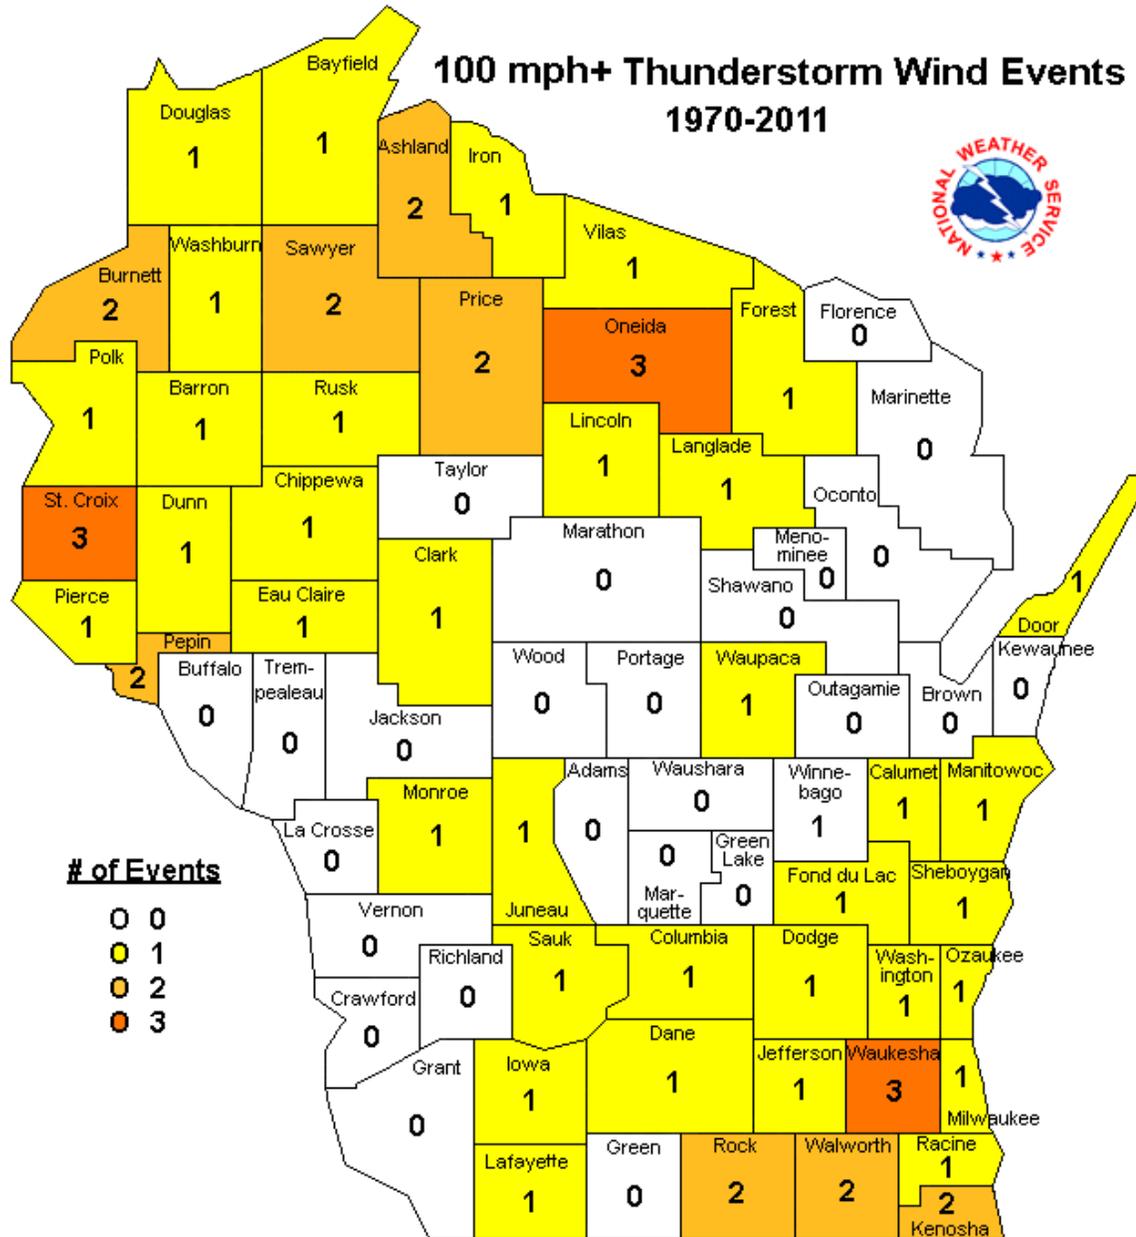

1844 - 2018

Events / # Deaths / # Injuries

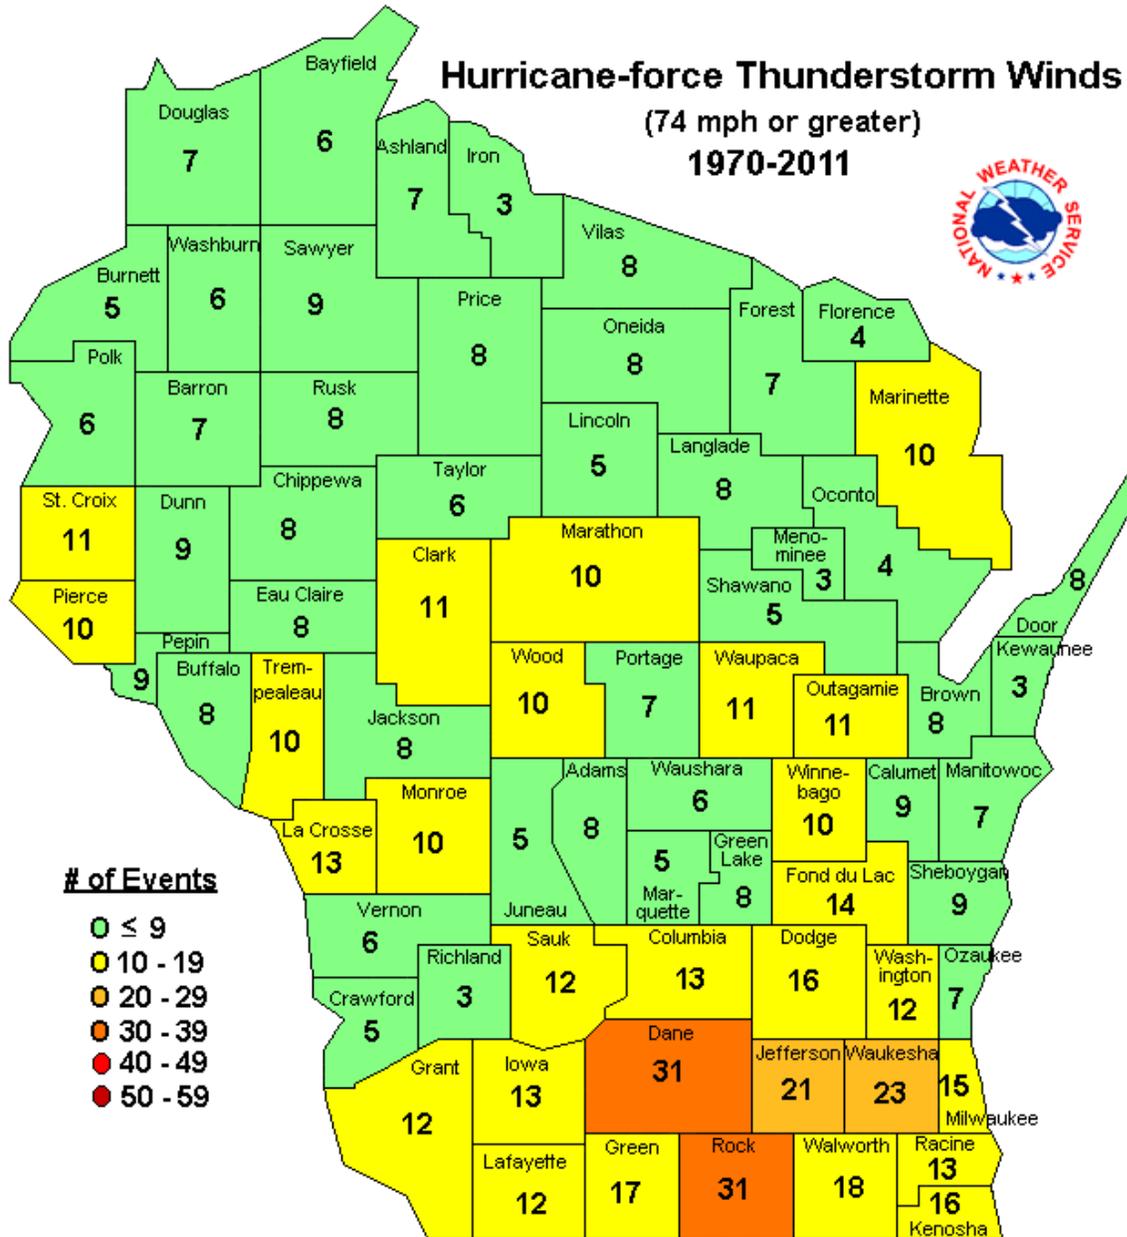

Severe thunderstorm wind is defined as straight line winds from a thunderstorm greater than 57 mph.

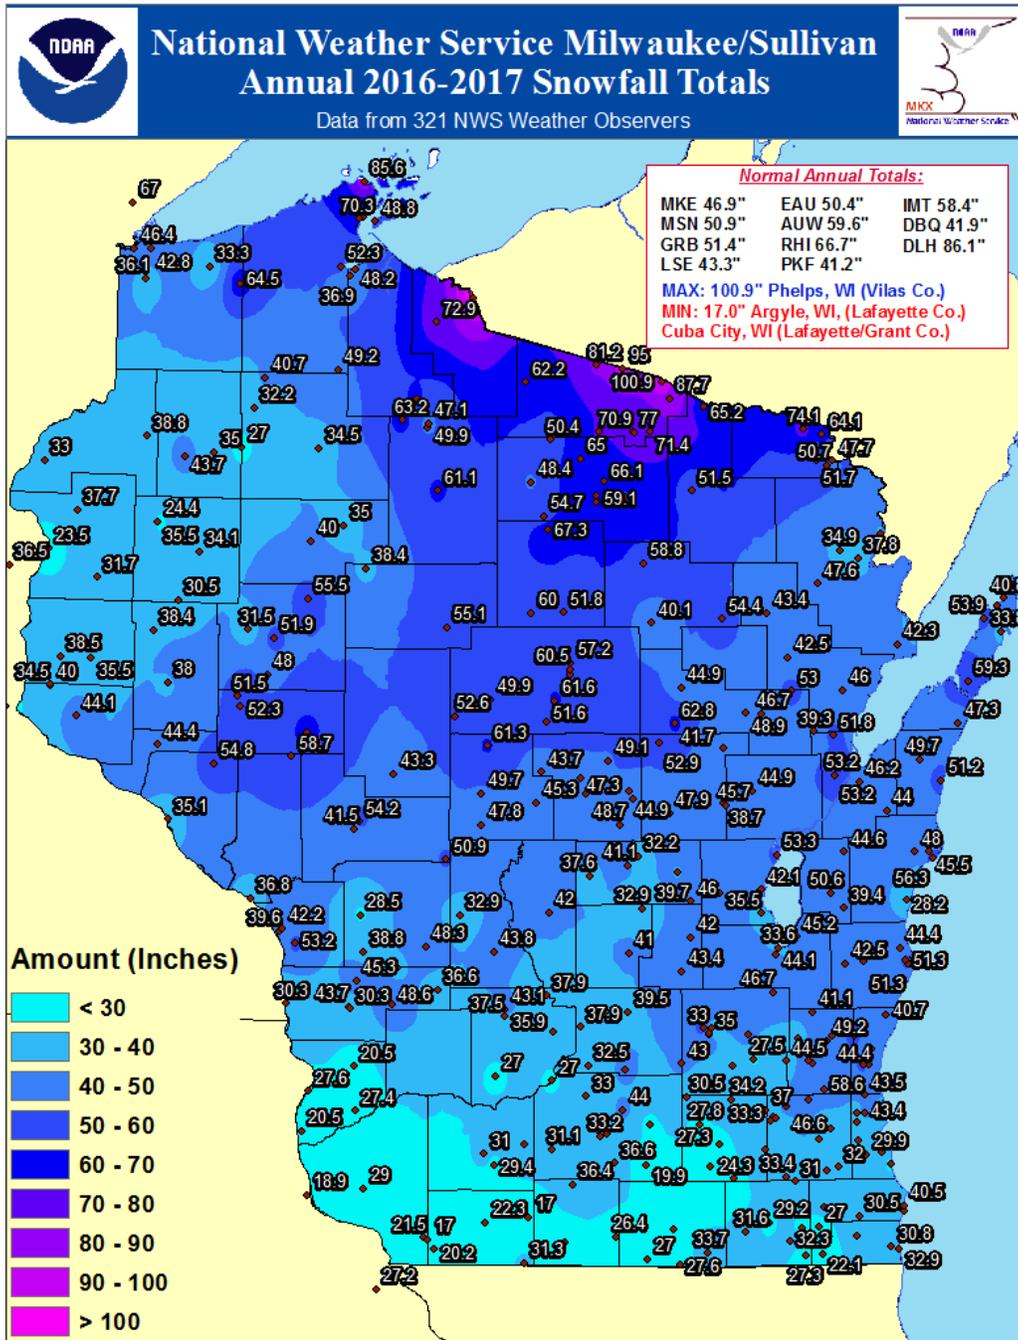

Wisconsin 100+ mph Thunderstorm Wind Events

Wisconsin Hurricane-force (74+ mph) Thunderstorm Winds

Wisconsin Average Seasonal Snowfall¹⁵²

Appendix C: Plan Adoptions

This plan update was approved by both Wisconsin Emergency Management (WEM) and the Federal Emergency Management Agency (FEMA). The plan has been adopted by Kewaunee County and its major municipal bodies including the Cities of Algoma and Kewaunee and the Villages of Casco and Luxemburg.

The Towns of Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Red River and West Kewaunee were also given an opportunity to adopt this plan. The Towns of Ahnapee, Carlton, Casco, Franklin, Luxemburg, Montpelier, Pierce, and Red River also adopted the plan. Scanned copies of those municipalities that adopted this plan follow.

STATE OF WISCONSIN
DEPARTMENT OF MILITARY AFFAIRS
DIVISION OF EMERGENCY MANAGEMENT

Darrell L. Williams, Ph.D.
Administrator

Tony Evers
Governor

February 18, 2020

Ms. Tracy Nollenberg, Director
Kewaunee County Emergency Management
625 Third Street
Luxemburg, WI 54217

Dear Ms. ^{Tracy}Nollenberg:

Wisconsin Emergency Management (WEM) has reviewed the *Hazard Mitigation Plan: Kewaunee County, Wisconsin*. The Federal Emergency Management Agency (FEMA) and WEM have signed a Program Administration by States operational agreement, dated November 6, 2018, allowing WEM to review local mitigation plans to ensure they meet the required criteria for a multi-jurisdiction hazard mitigation plan outlined in 44 CFR Part 201. Upon review, Kewaunee County has met the required criteria for a multi-jurisdictional hazard mitigation plan.

The county and participating jurisdictions *must now adopt* the plan in order to have a FEMA-approved hazard mitigation plan and be eligible for funding through the Hazard Mitigation Grant Program, Pre-Disaster Mitigation program, and the Flood Mitigation Assistance program.

I have emailed a copy of the Mitigation Plan Review Tool for your records.

If you have any questions, please feel free to call me at (608) 242-3252, or Katie Sommers, Mitigation Section Supervisor, at (608) 242-3222.

Sincerely,

A handwritten signature in blue ink, appearing to read "MZ", is written over a light blue horizontal line.

Ms. Tracy Nollenberg, Director
Kewaunee County Emergency Management
625 Third Street
Luxemburg, WI 54217

Dear Tracy:

It gives me great pleasure to inform you that the *Hazard Mitigation Plan: Kewaunee County, Wisconsin* has officially been approved by FEMA for the County and most participating jurisdictions! Approval for the final participating jurisdiction (Town of Pierce) is contingent upon receipt of their adoption resolution.

The plan complies with the requirements of the Disaster Mitigation Act of 2000. The approved jurisdictions are eligible to apply for funding through the Hazard Mitigation Grant Program, Building Resilient Infrastructure and Communities program, and Flood Mitigation Assistance program through April 8, 2025, for projects identified in the Plan. Per regulation, the Plan must be updated and resubmitted for approval every five years for the participating jurisdictions to remain eligible for mitigation funding.

Along with the Meets Requirements letter, you received the Local Mitigation Plan Review Tool, which includes recommended revisions for the five-year update.

Congratulations on the approval of your Plan! Our office commends the County for its commitment to mitigation and reducing future disaster losses, and we look forward to working with you in the future.

If you have any questions, please call me at (608) 242-3222 or Robyn Fennig at (608) 888-5292.

Sincerely,

Katie Sommers, CFM
Hazard Mitigation Section Supervisor

Ms. Robyn Fennig
State Hazard Mitigation Officer
Wisconsin Emergency Management
2400 Wright Street, P.O. Box 7865
Madison, WI 53707-7865

Dear Ms. Fennig:

Thank you for submitting the adoption documentation for the Kewaunee County Hazard Mitigation Plan. The plan was reviewed based on the local plan criteria contained in 44 CFR Part 201, as authorized by the Disaster Mitigation Act of 2000. The Kewaunee County plan met the required criteria for a multi-jurisdiction hazard mitigation plan and the plan is now approved for Kewaunee County; the cities of Algoma and Kewaunee; the villages of Casco and Luxemburg; and the towns of Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Red River, and West Kewaunee. Please submit the adoption resolutions for any remaining jurisdictions who participated in the planning process.

The approval of this plan ensures continued availability of the full complement of Hazard Mitigation Assistance (HMA) Grants. All requests for funding, however, will be evaluated individually according to the specific eligibility and other requirements of the particular program under which the application is submitted.

We encourage Kewaunee County and the participating jurisdictions to follow the plan's schedule for monitoring and updating the plan, and to continue their efforts to implement the mitigation measures. The expiration date of the Kewaunee County plan is five years from the date of this letter. To continue project grant eligibility, the plan must be reviewed, revised as appropriate, resubmitted, and approved no later than the plan expiration date.

Please pass on our congratulations to Kewaunee County; the cities of Algoma and Kewaunee; the villages of Casco and Luxemburg; and the towns of Ahnapee, Carlton, Casco, Franklin, Lincoln, Luxemburg, Montpelier, Red River, and West Kewaunee. If you or the communities have any questions, please contact Cadence Peterson at cadence.peterson@fema.dhs.gov or at 312-408-5260.

Sincerely,

A handwritten signature in black ink, appearing to read "Julia McCarthy".

RESOLUTION NO. 44-02-2020
**RESOLUTION ADOPTING THE KEWAUNEE COUNTY
 ALL HAZARDS MITIGATION PLAN**

TO THE HONORABLE KEWAUNEE COUNTY BOARD OF SUPERVISORS:

- 1 **WHEREAS**, Kewaunee County recognizes the threat that natural hazards pose to people and property;
 2 and
 3
 4 **WHEREAS**, under taking hazard mitigation actions before disasters occur will reduce the potential for
 5 harm to people and property and save tax payer dollars; and
 6
 7 **WHEREAS**, an adopted all hazards mitigation plan is required as a condition of future grant funding for
 8 mitigation projects; and
 9
 10 **WHEREAS**, Kewaunee County participated jointly in the planning update process with the other local
 11 units of government within the County to prepare an updated All Hazards Mitigation Plan.
 12
 13 **NOW, THEREFORE, BE IT RESOLVED**, by the Kewaunee County Board of Supervisors duly
 14 assembled this 11th day of February 2020, that the Board hereby adopts the Kewaunee County All
 15 Hazards Mitigation Plan as an official plan; and
 16
 17 **BE IT FURTHER RESOLVED**, that the Kewaunee County Emergency Management Department will
 18 submit, on behalf of the participating municipalities, the adopted All Hazards Mitigation Plan to Wisconsin
 19 Emergency Management and Federal Emergency Management Agency officials for final review and
 20 approval.

Respectfully Submitted,

PUBLIC SAFETY AND JUSTICE COMMITTEE

 LIO = Kewaunee County Land Information Office
 LWCD = Kewaunee County Land and Water Conservation Department
 PH = Kewaunee County Public Health Department

Appendix F: HAZUS Vulnerability Assessment

Kewaunee County Vulnerability Report

Identify Hazards

A flood risk assessment was prepared for Kewaunee County. The following flood hazards have been identified.

Wisconsin has experienced several major floods during the last three decades. The 1973, 1986 and 1990 floods revealed that no flood plains or urban areas in Wisconsin can be considered safe from damages. Mill-dams have developed leaks on occasion but have not caused any flooding problems. Kewaunee County historically does not have a serious flooding problem, with only one flood reported in Kewaunee County by the National Weather Service between January 1, 1950 and July 31, 2006. Kewaunee County has been included in two Presidential Disaster Declarations (in 1973 and 1990) based on the fact that they were contiguous to other counties with more damage. The following summarizes damages attributed to flooding in Kewaunee by the National Flood Insurance Program through December 19, 2003: Seven property losses in the City of Algoma and one property loss each in the City of Kewaunee and the Village of Luxemburg. There are no repetitive loss properties in Kewaunee County.

It should be noted that there has been some localized flooding primarily caused by heavy rainfall and run-off. A careful review of the geography and history of flooding in Kewaunee County leads to a belief that there is a low probability of flooding in the future and a low probability of damage and losses due to flooding. This flooding could occur due to river flooding, flash flooding or dam failure.

HAZUS-MH Hazard Analysis

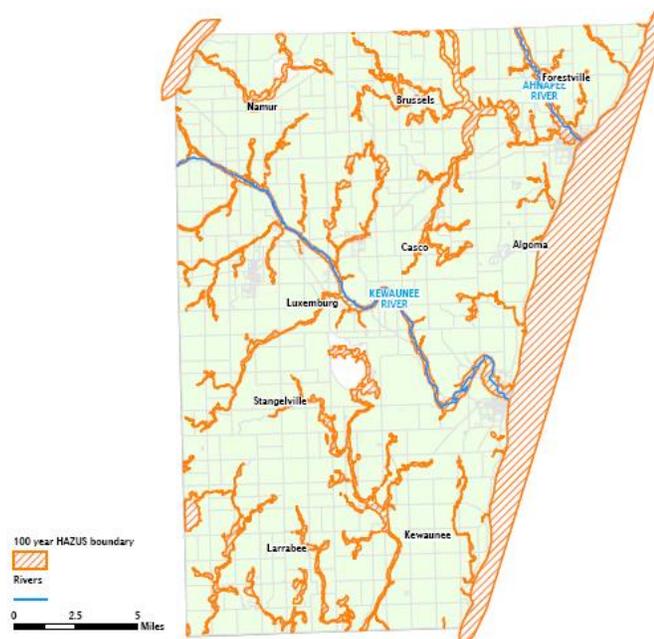

Flood analysis for Kewaunee County was performed using HAZUS-MH MR3 released in July 2007. The bundled aggregated general building stock was updated to Dun & Bradstreet 2006. Building valuations were updated to R.S. Means 2006. Building counts based on census housing unit counts are available for RES1 (single-family dwellings) and RES2 (manufactured housing) instead of calculated building counts.

The site-specific inventory (specifically Schools, Hospitals, Emergency Operation Centers, Fire Stations and Police Stations) was updated using the best available statewide information.

HAZUS-MH was used to generate the flood depth grid for a 100-year return period calculated for 1 square mile drainage areas. The riverine model was determined from a user provided USGS 30m DEM and peak discharge values obtained for 17 reaches tabulated in the Kewaunee County Flood Insurance Study. The coastal model was built from the 100-year stillwater elevations provided in the Kewaunee County Flood Insurance Study.

Figure 1 depicts the flood boundary from the HAZUS-MH analysis. The majority of damages due to flooding occur along the Ahnapee River and the Kewaunee River.

Figure 1: Kewaunee County HAZUS-MH Analysis (100-Year Flood)

HAZUS-MH Aggregate Loss Analysis

HAZUS-MH was used to estimate the damages for a 100-year flood event in Kewaunee County. An estimated 147 buildings will be damaged totaling \$22.5 million in building losses and \$57 million in total economic losses. The total estimated number of damaged buildings, total building losses, and estimated total economic losses are shown in Table 1.

HAZUS-MH estimates 10 census blocks with losses exceeding \$1 million. The distribution of losses is shown in Figure 2.

HAZUS-MH aggregate loss analysis is evenly distributed across a census block. Census blocks of concern should be reviewed in more detail to determine the actual percentage of facilities that fall within the flood hazard areas. The aggregate losses reported in this study may be overstated. Examples are provided in Figure 3.

Table 1: Kewaunee County Total Economic Loss - 100-Year Flood

General Occupancy	Estimated Total Buildings	Total Damaged Buildings	Total Building Exposure X 1000	Total Economic Loss X 1000	Building Loss X 1000
Agricultural	1	0	\$40,617	\$1,068	\$221
Commercial	31	0	\$207,075	\$14,972	\$4,335
Education	0	0	\$39,899	\$436	\$58
Government	1	0	\$8,835	\$511	\$72
Industrial	29	8	\$85,219	\$16,545	\$3,570
Religious/Non-Profit	3	0	\$13,535	\$1,286	\$168
Residential	7,328	139	\$1,122,388	\$22,291	\$14,096
Total	7,393	147	\$1,517,568	\$57,109	\$22,520

The reported building counts should be interpreted as degrees of loss rather than as exact numbers of buildings exposed to flooding. These numbers were derived from aggregate building inventories which are assumed to be dispersed evenly across census blocks. HAZUS-MH requires that a predetermined amount of square footage of a typical building sustain damage in order to produce a damaged building count. If only a minimal amount of damage to buildings is predicted, it is possible to see zero damaged building counts while also seeing economic losses.

Figure 2: Kewaunee County Total Economic Loss - 100-Year Flood

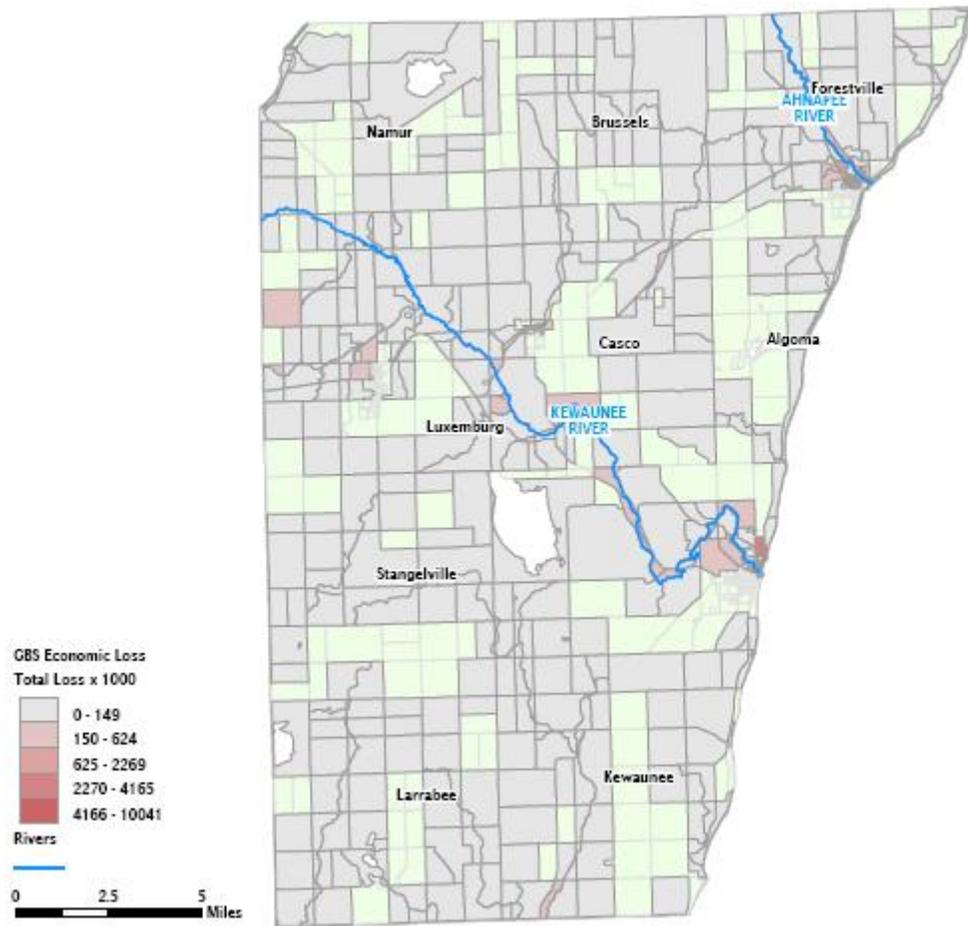

Figure 3a: Flood Damage Exposure in Luxemburg

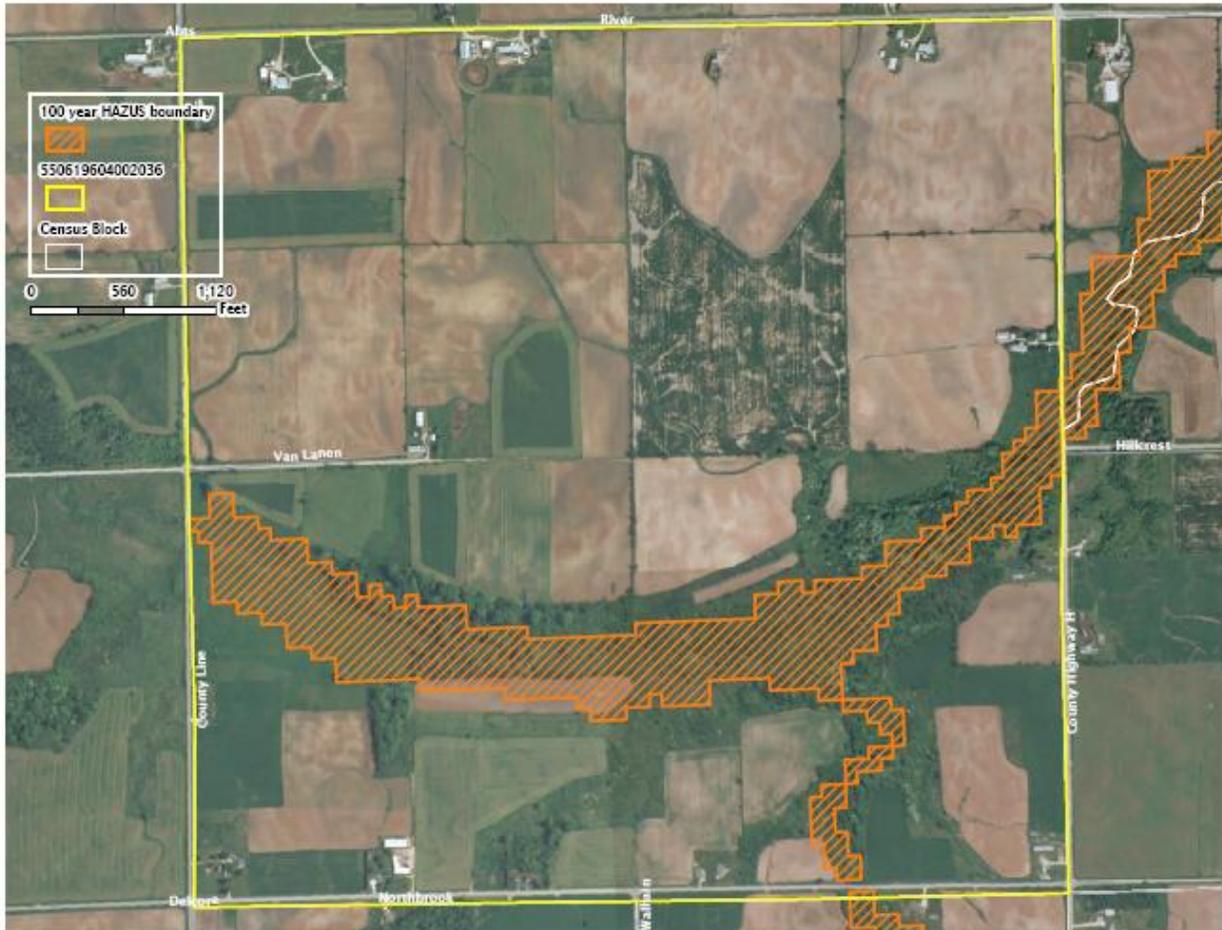

Figure 3a shows census blocks overlaid with the flood boundary and orthophoto of Luxemburg. Census block 550619604002036 has an estimated building loss of \$43 thousand with a combined replacement cost of \$191 thousand. HAZUS-MH estimates that 14 buildings are within the calculated flood boundary for this block. However, the orthophoto shows this area to be mainly forest, with no buildings at risk.

Figure 3b: Flood Damage Exposure in Casco

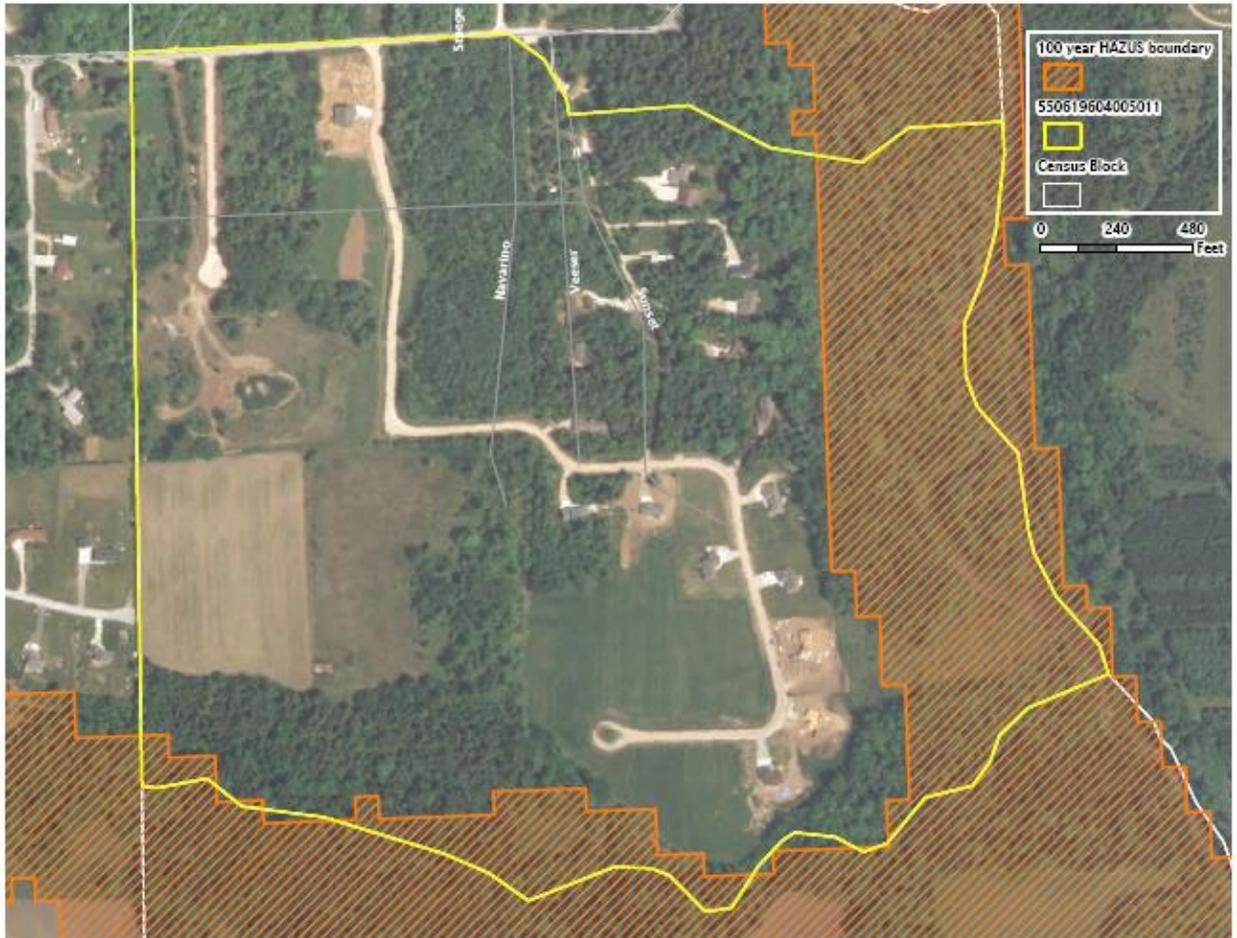

Figure 3b shows census blocks overlaid with the flood boundary and orthophoto of Casco. Census block 550619604005011 has an estimated building loss of \$170 thousand with a combined replacement cost of \$280 thousand. HAZUS-MH estimates that 22 buildings are within the calculated flood boundary for this block. However, the orthophoto shows this area to be mainly forest, with no buildings at risk.

HAZUS-MH Essential Facility Loss Analysis

Essential facilities encounter the same impacts as other buildings within the flood boundary: structural failure, extensive water damage to the facility, and loss of facility functionality (i.e. a damaged police station will no longer be able to serve the community).

The HAZUS-MH analysis identified one Fire Station and one Police Station that may be subject to flooding. A list of the essential facilities within Kewaunee County is included in Tables 2 and 3. A map of essential facilities potentially at risk to flooding is shown in Figure 4.

Table 2: Kewaunee County Essential Facility Loss - 100-Year Flood

Class	Building Count	At Least Moderate Damage	At Least Substantial Damage	Loss of Use
Care Facilities	2	0	0	0
EOC	0	0	0	0
Fire Stations	7	1	0	0
Police Stations	6	1	0	0
Schools	18	0	0	0
Total	33	2	0	0

Table 3: Kewaunee County Damaged Essential Facilities

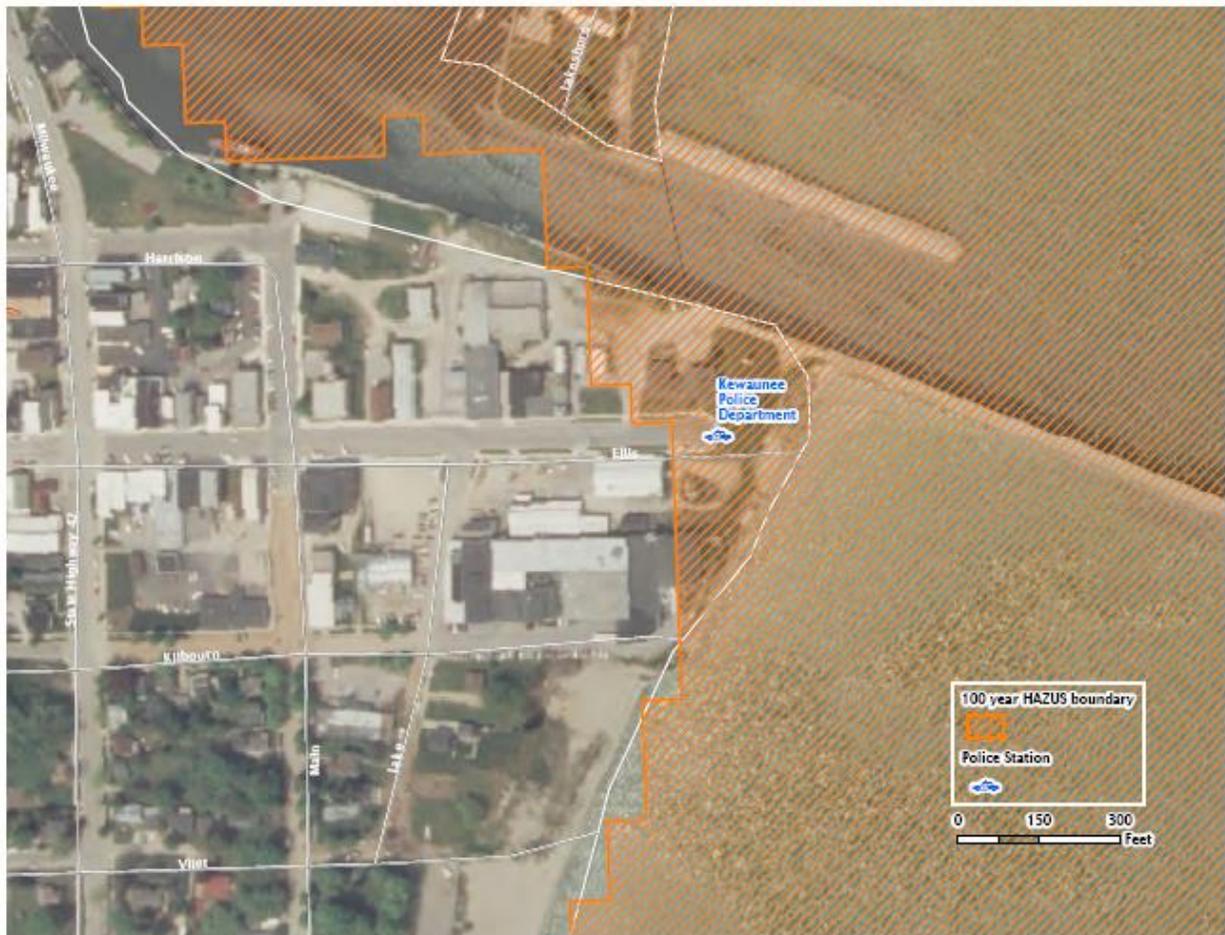

Facility Name
Tisch Mills Fire Department
Kewaunee Police Department

Figure 4: 100-Year Flood Boundary Overlaid with Essential Facilities

Appendix F: HAZUS Vulnerability Assessment

Figure 4b: 100-Year Flood Boundary Overlaid with Essential Facilities

HAZUS-MH Shelter Requirement Analysis

HAZUS-MH estimates the number of households that are expected to be displaced from their homes due to the flood and the associated potential evacuation. HAZUS-MH also estimates those displaced people that will require accommodations in temporary public shelters. The model estimates 564 households will be displaced due to the flood. Displacement includes households evacuated from within or very near to the inundated area. Of these 587 people (out of a total population of 20,187) will seek temporary shelter in public shelters.

HAZUS-MH State Property Loss Analysis

The flood boundaries were overlaid with the State of Wisconsin property boundaries as provided by the Department of Natural Resources. Table 4 provides a list of state properties impacted by the flood boundary. Figures 5a and 5b show examples of the inundated areas.

Table 4: Kewaunee County State Property Flood Inundation

State Property	Percent Inundated	Acres Inundated
C.D. (Buzz) Besadny Fish and Wildlife Area	38%	988
Ahnapee State Trail	18%	103

Figure 5a: Boundary of 100-Year Flood Overlaid with State of Wisconsin Properties

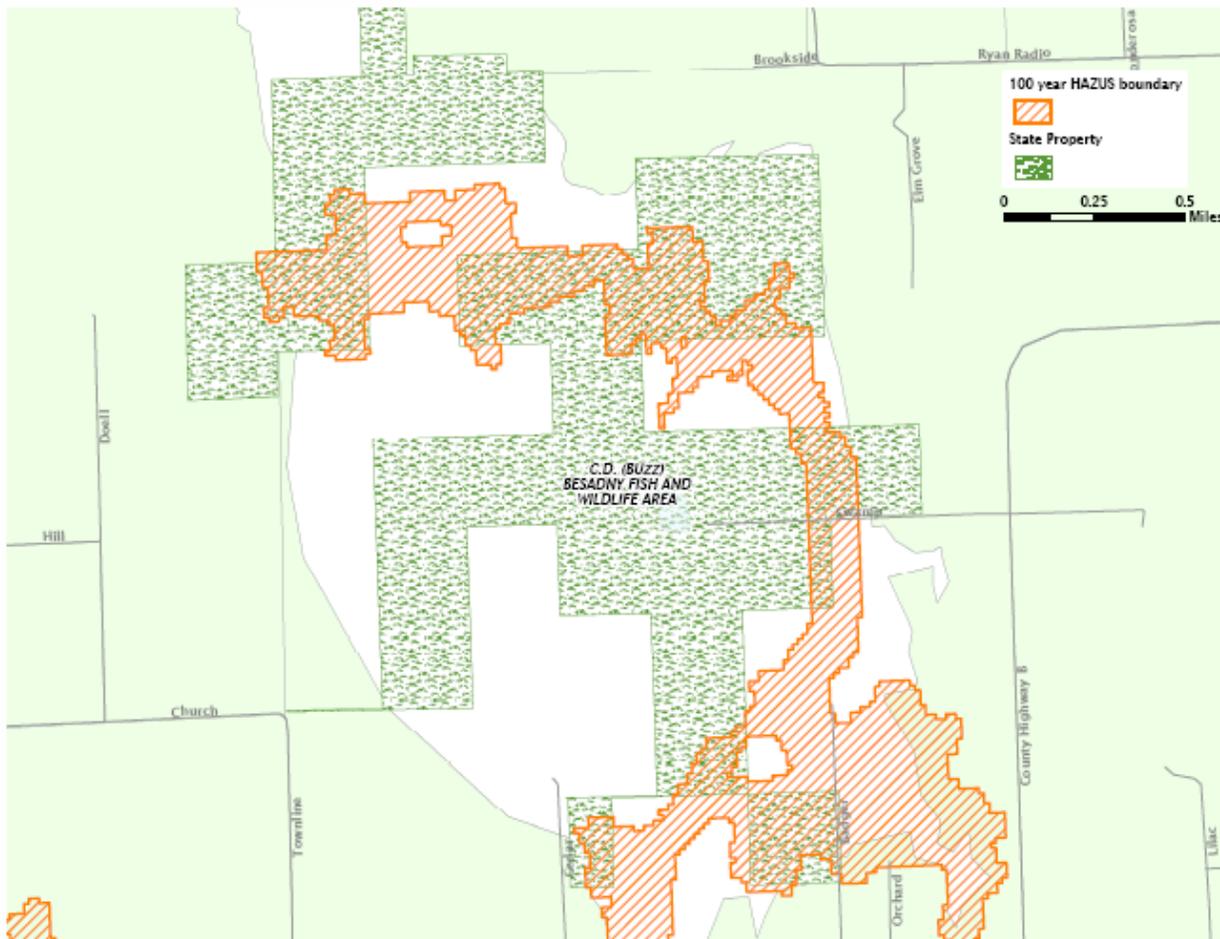

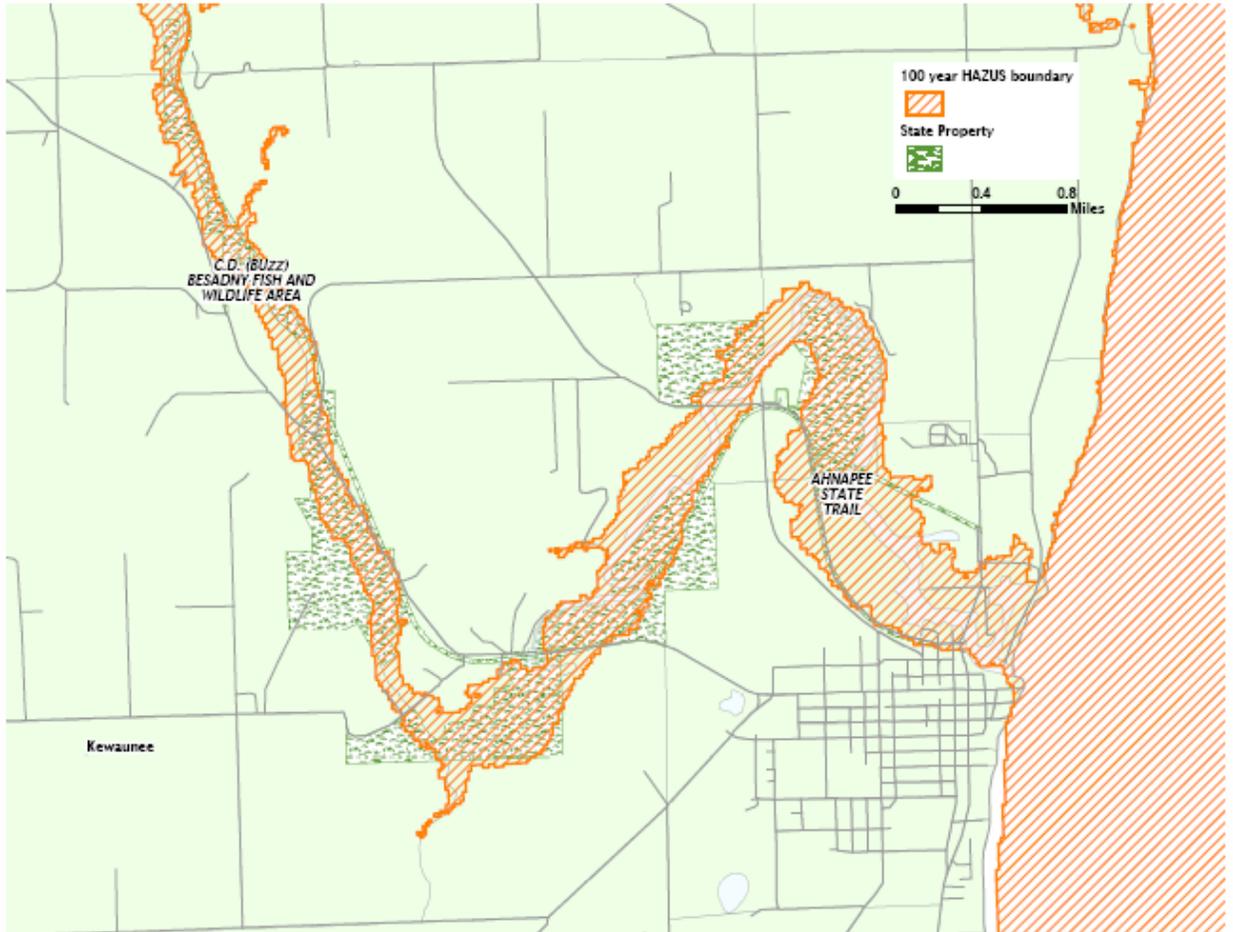

Figure 5b: Boundary of 100-Year Flood Overlaid with State of Wisconsin Properties

Appendix F: Community Input

Kewaunee County believes in the importance of gathering public input from interested parties in the community. To achieve this goal, the Emergency Management Office took every opportunity available to utilize various methods to publicize the opportunity for people to participate in the planning process and to gather input from interested parties. The table that follows outlines the major opportunities that were created to discuss the plan. The table includes dates of workgroup meetings, meetings with public officials and media opportunities.

DATE	SUMMARY OF OPPORTUNITY
10/8/2018	Hazards survey sent to each town, village and city with the request that they discuss it and return the data. This letter also invited elected officials and other town, village, and city staff to participate in the planning process.
10/8/2018	Press release inviting people to participate in the planning process
11/12/2018	Introduce the hazard mitigation plan update process, the plan and discuss mitigation strategies with the Kewaunee County Towns Association.
3/26/2019 3/27/2019	Kewaunee County hazard mitigation workgroup meetings with municipalities and county department leaders.
1/15/20	Legal public notice provided to the paper of record.
1/16/20	Final press release provided to media outlets.
Qtr 1, 2020	Emergency Management provided each municipality with a draft plan for elected official and public review. Kewaunee County as well as every city, village and town in the county placed discussion about and adoption of the hazard mitigation plan on a public agenda (in accordance with Wisconsin's Open Meeting laws) and then publicly discussed and adopted the plan in open session.

County Department Manager
From: Tracy Nollenberg, EM Director
Re: Hazard Mitigation Plan Update

Kewaunee County, like the rest of the State of Wisconsin, is vulnerable to a variety of disasters. According to the National Oceanographic and Atmospheric Administration (NOAA), 2017 was the costliest year ever for weather and climate disasters in the United States, totaling \$215 billion in disasters or, to look at it another way, \$5.9 million dollars every week! Closer to home, Wisconsin has also incurred billions of dollars of disaster-related damages in the last couple of decades. These losses can be reduced through mitigation activities. A 2017 study has estimated that mitigation saves society an average of \$8 for every \$1 spent through federal agency grant programs. Hazard mitigation breaks the cycle of damage and repair.

Mitigation actions reduce or eliminate the long-term risk to human life and property from hazards. These preventative actions can be simple such as elevating a furnace in a basement that sometimes has water on the floor. Mitigation can also have a comprehensive approach such as relocating buildings out of the floodplain or strengthening critical facilities to prevent wind damage and provide stronger shelter.

In an effort to better prepare Kewaunee County to manage its vulnerability to disaster Kewaunee County Emergency Management applied for and received a hazard mitigation planning update grant. This goal of this grant is to complete an approvable updated plan, which will serve as a roadmap that outlines potential cost-effective hazard mitigation activities, some of which might be available for future grant funding.

The plan is designed to look at the risks and vulnerabilities that the county faces from natural disaster and to highlight mitigation strategies that might reduce future losses to life and property. As part of this planning process, I need your help.

The first step is asking that you please place an item on your next municipal meeting agenda to complete the attached survey. This very short survey will help us to identify the concerns that you have in your municipality and to capture ideas that you have for making your community safer and more disaster resistant. Please return your completed surveys to me by November 30th or bring them to the November Town Association Meeting.

After receiving your surveys, the information will be incorporated into the draft plan, which is being guided by a workgroup of interested agencies and public members. I would like to extend an offer for anyone from your leadership council, your municipal staff or your general community to contact me if they would like to join the workgroup.

Finally, after the workgroup has a final draft, we will be sending copies of the plan to each of you for final review and adoption. It is important to note two things:

- Adoption of this plan will not cost your community anything. You will not be committing to completing any of the projects listed; instead it is a list of triaged ideas that can be accomplished should the funding and will to complete them become available.
- If you do not adopt this plan, your community will not be eligible to apply for and receive mitigation project funding in the future.

Let me thank you in advance for the assistance that you are providing. This small investment of your time will help make our community a safer, healthier and more disaster-resistant community for years to come.

If you are interested in more information about the plan or would like to provide input into the plan, please feel free to contact me at (920) 845-9701 or by email at nollenbero.tracy@kewauneeeco.org.

For Immediate Release

Kewaunee County Receives A Hazard Mitigation Planning Update Grant

(Luxemburg, WI) Kewaunee County, like the rest of the State of Wisconsin, is vulnerable to a variety of disasters. According to the National Oceanographic and Atmospheric Administration (NOAA), 2017 was the costliest year ever for weather and climate disasters in the United States, totaling \$215 billion in disasters or, to look at it another way, \$5.9 million dollars every week! Closer to home, Wisconsin has also incurred billions of dollars of disaster-related damages in the last couple of decades. These losses can be reduced through mitigation activities. A 2017 study has estimated that mitigation saves society an average of \$6 for every \$1 spent through federal agency grant programs by breaking the cycle of damage and repair.

Mitigation actions reduce or eliminate the long-term risk to human life and property from hazards. These preventative actions can be simple such as elevating a furnace in a basement that sometimes has water on the floor. Mitigation can also have a comprehensive approach such as relocating buildings out of the floodplain or strengthening critical facilities to prevent wind damage and provide stronger shelter.

In an effort to better prepare Kewaunee County to manage its vulnerability to disaster, Tracy Nollenberg, Kewaunee County Emergency Management Director, applied for and received a hazard mitigation planning update grant. This goal of this grant is to update an approvable plan, which will serve as a roadmap that outlines potential cost-effective hazard mitigation activities, some of which might be available for future grant funding.

The plan is designed to look at the risks and vulnerabilities that the county faces from natural disaster and to highlight mitigation strategies that might reduce future losses. As part of this planning process, Nollenberg is assembling a workgroup to review and guide the planning activities. The workgroup is reviewing initial background information about Kewaunee County and has begun identifying strategies that might help.

Nollenberg stated, "I am very excited about this part of the planning process. The input from the workgroup can have long-lasting impacts, making Kewaunee County safer and more disaster resistant."

FEMA has recognized the importance of having members of the community involved in the process and Nollenberg would like to ensure that all interested members of the community have an opportunity to provide input into the plan. If you are interested in more information about the plan or would like to provide input into the plan, please contact Tracy Nollenberg at 920-845-9701.

19 February 2019

Dear Municipal Official:

The Kewaunee County Emergency Management Office has received a grant from the Federal Emergency Management Agency (FEMA) and Wisconsin Emergency Management to complete an update of the Hazard Mitigation Plan for Kewaunee County because as with any plan, it needs to be evaluated and updated on a regular basis to outline progress and to set a roadmap for future mitigation efforts.

The plan reviews the risks for various natural disasters within Kewaunee County and creates a plan for addressing these risks in a cost-effective way. As I am sure you are aware, Kewaunee County has received several federal disaster declarations in recent history and we are at continued risk for future events such as flooding, high winds and tornados; this planning is intended to help reduce potential future losses. Also, the federal government requires that communities have a current hazard mitigation plan as one criterion for eligibility for some types of grants so it is critical that this plan is completed and kept updated on schedule.

This requires significant input from stakeholder agencies and the public during the planning process. In order for your agency to be eligible for **future FEMA mitigation funding, your agency must participate in these planning sessions**. I have contracted with Lenora Borchardt, EPTEC, INC., to assist me with completing this update. In order to be eligible for FEMA mitigation funding your **municipality must send at least one representative** to be a member of our planning team. Team members will be asked to be available to assist the contractor answering questions needed to complete the plan and to attend these occasional meetings.

Our first team meeting is scheduled for 26 March 2019 at 6:00 p.m. at the Kewaunee County Emergency Operations Center, 625 Third Street, Luxemburg. I anxiously await notification of your decision; please RSVP with which time you will attend by **12 March** or contact me with any questions or concerns at (920) 845-9701.

Sincerely,

Tracy Nollenberg, Director
Kewaunee County Emergency Management

KEWAUNEE COUNTY, WISCONSIN NATURAL HAZARDS PREPAREDNESS & MITIGATION QUESTIONNAIRE

1. Name of person completing the survey _____

Contact number of person completing survey _____

2. In the past five years, has your community experienced a natural disaster such as a severe windstorm, flood, wildfire, earthquake, etc.?

- NO..... (If NO, skip to Question 2)
- YES..... (If YES, please check all that apply below)

Event	When event last occurred:				
	Within past year	1-5 years ago	5-15 years ago	More than 15 years ago	Never
Drought				TN: Carlton TN: Lincoln TN: Montpelier	CI: Kewaunee
Dust Storm					CI: Kewaunee TN: Montpelier TN: Pierce
Earthquake					TN: Montpelier TN: Pierce
Flood	CI: Kewaunee	CI: Kewaunee	CI: Kewaunee	CI: Kewaunee TN: Montpelier	
Lakeshore Erosion	CI: Kewaunee TN: Pierce	CI: Kewaunee	CI: Kewaunee	CI: Kewaunee TN: Carlton	TN: Montpelier
Landslide/ Debris Flow	CI: Kewaunee	CI: Kewaunee			TN: Montpelier TN: Pierce
Wildfire				TN: Lincoln	CI: Kewaunee TN: Montpelier TN: Pierce
Windstorm/ Tornado	TN: Pierce	CI: Kewaunee - 8/12/16 TN: Carlton TN: Montpelier		TN: Lincoln	
Severe Winter Storm	CI: Algoma CI: Kewaunee TN: Carlton TN: Casco TN: Lincoln TN: Luxemburg TN: Montpelier TN: Pierce	CI: Kewaunee	CI: Kewaunee TN: Casco	CI: Kewaunee	

CI: Algoma – Multi- Jurisdiction: Marina Fire 2016

**3. For which of the following natural disasters do you think your community is at risk?
(Check the appropriate box for each hazard.)**

Event	Extremely Concerned	Very Concerned	Concerned	Somewhat Concerned	Not Concerned
Drought		TN: Ahnapee	CI: Kewaunee TN: Lincoln TN: Luxemburg	TN: Carlton TN: Montpelier TN: Red River	CI: Algoma
Dust Storm					CI: Algoma CI: Kewaunee TN: Carlton TN: Lincoln TN: Montpelier TN: Red River
Earthquake					CI: Algoma TN: Carlton TN: Lincoln TN: Montpelier TN: Red River
Flood	CI: Algoma CI: Kewaunee		TN: Montpelier	TN: Lincoln TN: Red River	TN: Carlton
Erosion	CI: Kewaunee		CI: Algoma – Lake/river levels TN: Lincoln TN: Montpelier	TN: Carlton	TN: Red River
Landslide/ Debris Flow		CI: Kewaunee			CI: Algoma TN: Carlton TN: Lincoln TN: Montpelier TN: Red River
Wildfire			CI: Algoma - Fire District	TN: Lincoln	CI: Kewaunee TN: Carlton TN: Montpelier TN: Red River
Windstorm/ Tornado		CI: Kewaunee TN: Ahnapee	TN: Lincoln TN: Montpelier	CI: Algoma – Water Spout TN: Carlton TN: Red River	
Severe Winter Storm/ Ice Storm	CI: Kewaunee TN: Montpelier	TN: Ahnapee	CI: Algoma TN: Casco TN: Lincoln TN: Luxemburg	TN: Carlton TN: Red River	
Other:				CI: Kewaunee - We may be in danger of a possible Seiche - a huge wave hitting our lakefront	TN: Carlton
Other:					TN: Carlton

4. Has your community had damage to facilities or infrastructure? If yes, please describe the damage. (e.g., roads, public buildings, utilities)

CI: Kewaunee - Yes, in 2018, our municipal sewage treatment plant has flooded three times during significant rain events. This costs tens of thousands of dollars each time for new equipment.

In 2016, the City experienced a tornado which caused damage to city parks and city streets and huge expenses in staff time for recovery efforts.

CI: Algoma – None recalled at this time!

TN: Ahnapee – NO

TN: Carlton – Private buildings and utilities in a wind storm

TN: Montpelier – Road and Utility damages; Culvert wash out; Structure damages – i.e.: Barns; Crop damages

TN: Red River – NO

5. What facilities or infrastructure in your community do you think are especially vulnerable to damage during a natural disaster?

CI: Kewaunee - Our sewage treatment plant, our public spaces, parks and lakefront, and our roads and infrastructure due to flooding.

CI: Algoma – Residential – Lakeshore; River

Industrial – River

Nursing Home/Schools/Public Buildings – Tornado

TN: Carlton – Barns, Homes, and utilities

TN: Casco – Excessive cost to plow roads

TN: Montpelier – Roads and Bridges; Utility

TN: Pierce – Roads – culverts; Green Bay Water Utility

TN: Red River – Roads near streams if there would be a large flood

6. How important do you think each of the following projects are in mitigating (i.e., lessening the impacts of) a natural disaster in your community?

Project	Very Important	Somewhat Important	Neutral	Not Very Important	Not Important
Protecting private property	CI: Algoma TN: Ahnapee TN: Carlton TN: Pierce	TN: Casco	CI: Kewaunee TN: Lincoln TN: Luxemburg TN: Montpelier		TN: Red River
Protecting critical facilities (hospitals, fire stations, etc.)	CI: Algoma – Water/Communication Towers CI: Kewaunee TN: Carlton TN: Lincoln TN: Pierce	TN: Casco – None TN: Red River	TN: Luxemburg TN: Montpelier		
Preventing development in hazard areas	TN: Lincoln TN: Pierce	CI: Kewaunee TN: Carlton TN: Casco TN: Montpelier TN: Red River	TN: Luxemburg		CI: Algoma
Enhancing the function of natural features (streams, wetlands)	CI: Kewaunee TN: Carlton TN: Lincoln TN: Pierce	TN: Ahnapee TN: Casco TN: Montpelier TN: Red River	TN: Luxemburg	CI: Algoma

7. Do you have any community building projects (e.g., subdivisions, office/industrial parks, roads) slated to be built in the near future? If so, please describe it (e.g., project name, location, type, size)?

CI: Kewaunee - We will be replacing sanitary sewer, storm water and potable water mains on River Road in 2019.

CI: Algoma – 12 Unit condominium complex along lakeshore located at intersection of Hwy 42 & County K.

TN: Carlton – NO

TN: Casco – None

TN: Lincoln – We are building a new town hall in 2019. Maple Rd. 36x40 on floating slab. Building with room for first responders' storage.

TN: Luxemburg – NO

TN: Montpelier – NO

TN: Pierce – NO

TN: Red River – NO

8. What ideas do you have for your community to mitigate natural disasters?

CI: Kewaunee - We need funds to address the current and future impacts of climate change. The Springs and Autumns are much wetter and consequently we are experiencing flooding on a regular basis during these seasons. Our infrastructure, which was designed for a 100-year rain event, is experiencing such events on a regular basis

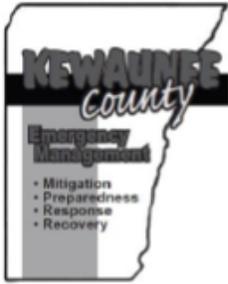

TN: Carlton – To have and maintain an informative alert system

TN: Casco – Assistance when major snowstorms hit county and state

TN: Lincoln – Given what goes on in our county with our water quality, I think there should be some sort of plan.

TN: Montpelier – Rebuild bridges (Outdated)

TN: Red River – Control where structures are built

Public Notice

Kewaunee County has completed the draft of a Hazard Mitigation Plan Update, prepared in accordance with the Disaster Mitigation Act of 2000 (Public Law 106-390; DMA2K). The draft is available for public comment until January 31, 2020. The plan is available for public review at County Clerk office, 810 Lincoln Street, Kewaunee or online at www.kewauneeco.org.

If you have questions related to this notice or its application in Kewaunee County, call the Kewaunee County Emergency Management office at (920) 845-9701.

Re: Pre-Disaster Mitigation (PDM) Plan Update

As you are aware, Kewaunee County, like the rest of the State of Wisconsin, is vulnerable to a variety of disasters. Wisconsin has incurred disaster-related damages totaling over \$3 billion in the last three decades but future losses can be reduced through mitigation activities. It is estimated that for every dollar spent on mitigation, \$6 in future damages can be avoided. Hazard mitigation breaks the cycle of damage and repair by reducing or eliminating the long-term risk to human life and property from hazards. These preventative actions can be simple such as elevating a furnace in a basement that sometimes has water on the floor. Mitigation can also take a comprehensive approach such as relocating buildings out of the floodplain or strengthening critical facilities to prevent wind damage and provide stronger shelter.

In an effort to better prepare Kewaunee County to manage its vulnerability to disaster, Kewaunee County Emergency Management, applied for, received and has now completed a Pre-Disaster Mitigation (PDM) **update** planning grant. The resulting updated plan serves as a roadmap that outlines potential cost-effective hazard mitigation activities, some of which might be available for future grant funding. The plan highlights the risks and vulnerabilities that the county faces from natural disaster and highlights mitigation strategies that might reduce future losses. We are sending copies of the workgroup's final updated plan and a draft resolution for you to use for the re-adoption of the plan.

Please include adoption of this resolution on your next meeting agenda and send a copy of the final passed resolution to Kewaunee County Emergency Management, 625 3rd Street., Luxemburg, WI 54217. If you have any questions or comments regarding this plan update, please feel free to contact me at (920) 845-9701 or by email at Nollenberg.tracy@kewauneeeco.org

It is important to note two things:

- **Adoption of this plan will not cost your community anything.** You will not be committing to completing any of the projects listed; instead it is a list of triaged ideas that can be accomplished should the funding and will to complete them become available.
- **If you do not adopt this plan, your community will not be eligible to apply for and receive mitigation project funding in the future.**

Let me thank you in advance for the assistance that you are providing. This small investment of your time will help make our community a safer, healthier and more disaster-resistant community for years to come.

KEWAUNEE COUNTY DRAFT HAZARD MITIGATION PLAN UPDATE AVAILABLE FOR REVIEW

(Luxemburg, WI) Kewaunee County, like the rest of the State of Wisconsin, is vulnerable to a variety of disasters. Wisconsin has incurred disaster-related damages totaling over \$3 billion in the last three decades but future losses can be reduced through mitigation activities. A recent study by the Multi-hazard Mitigation Council shows that each dollar spent on mitigation saves society an average of six dollars. Since 1993 more than 400 disasters have occurred in the United States, affecting communities in all 50 states, costing the country over \$500 million dollars per week and killing over 24,000 people.

Mitigation actions reduce or eliminate the long-term risk to human life and property from hazards. These preventative actions can be as simple as elevating a furnace in a basement that sometimes has water on the floor. Mitigation can also have a comprehensive approach such as relocating buildings out of the floodplain or strengthening critical facilities to prevent wind damage and provide stronger shelter.

In an effort to better prepare Kewaunee County to manage its vulnerability to disasters, Kewaunee County Emergency Management applied for, received and has completed a Pre-Disaster Mitigation (PDM) update planning grant. This plan update will serve as a roadmap that outlines potential cost-effective hazard mitigation activities, some of which might be available for future grant funding. The updated plan outlines the risks and vulnerabilities that the county faces from natural disaster and highlights mitigation strategies that might reduce future losses. The completed draft hazard mitigation plan update is available for review and public comment until January 31, 2020 at the County Clerk Office, 810 Lincoln Street, Kewaunee WI 54216 or online at www.kewauneeeco.org.

###

GOVERNMENTAL & PUBLIC INPUT

Planning creates a way to solicit and consider input from diverse interests. Successful community mitigation begins with a commitment from government officials throughout the county.

Involving stakeholders is essential to building community-wide support for the plan. In addition to emergency managers, the planning process involves other government agencies (e.g., zoning, floodplain management, public works, community and economic development), businesses, civic groups, environmental groups and schools. Vital information provided by these groups helps insure that the plan is workable within the framework of the community's priorities.

ADOPTION OF THE PLAN

Local units of government participating in a multi-jurisdictional planning process must adopt the final plan for the municipality to be eligible for future mitigation funds including grants available through FEMA. **Local units (i.e., towns, villages, cities) that do not participate would be ineligible to receive such funds** until such time that they meet these requirements and adopt a plan.

HISTORY

Floods and storms have killed over 2,000 people in the U.S. in the last decade. Hundreds of disasters have occurred in the past 25 years, costing the country millions of dollars every week.

MITIGATION PLANNING FACTS

- ▶ A 2017 study has shown that mitigation saves society an average of \$6 for every \$1 spent through federal agency grant programs.
- ▶ The rigorous building standards adopted by 20,000 communities across the country are saving the nation more than \$1.1 billion a year in prevented flood damages.
- ▶ Hazard mitigation plans and projects reduce overall risks to the population and structures while also reducing reliance on funding from actual disaster declarations.
- ▶ According to the National Oceanographic and Atmospheric Administration, 2017 was the costliest year ever for weather and climate disasters in the United States, totaling \$215 billion in disasters. That's \$5.9 million dollars every week!

WHAT IS HAZARD MITIGATION?

Hazard mitigation is sustained action taken to reduce or eliminate long-term risk to people and their property from hazards.

Floods, ice storms, tornadoes and forest/wild fires – these are all functions of the natural environment and only become hazardous when they threaten our “built” environment with destruction. These hazards will occur one day. When this happens, the results can be appreciably different from past outcomes if our community takes action today.

RISK REDUCTION

The goal of risk reduction is to reduce the risk to life and property, which includes existing structures and future construction, in the pre- and post-disaster environments. This is achieved through regulations, local ordinances, land use and building practices and mitigation projects that reduce or eliminate long-term risk from hazards and their effects.

WHY DEVELOP A PLAN?

Mitigation plans form the foundation for a community’s long-term strategy to reduce disaster losses and break the cycle of disaster damage, reconstruction and repeated damage. The planning process is as important as the plan itself. It creates a framework for risk-based decision-making to reduce damages to lives,

property and the economy from future disasters.

State, tribal and local governments are required to develop a hazard mitigation plan as a condition for receiving certain types of non-emergency disaster assistance. The Robert T. Stafford Disaster Relief and Emergency Assistance Act (Public Law 93-288), as amended by the Disaster Mitigation Act of 2000, provides the legal basis for state, local and tribal governments to undertake a risk-based approach to reducing risks from natural hazards through mitigation planning.

Like many other people, the residents of Merkel, Texas didn't think much about flooding. Besides, it had not flooded in Merkel for 45 years. It wasn't until the heavy summer rains came that residents realized flooding can hit anyone, at any time. After the flooding finally subsided, officials knew they had to do something: mitigate.

REQUIRED INFORMATION

- Flood maps
- Identification of potential hazards
- History of occurrences
- Hazard impact projections
- Location of critical facilities
- Identification of high-risk facilities (schools, fire station, nursing homes, etc.)
- Location of repetitive loss structures
- Development & prioritization of mitigation projects
- Other materials as identified

HAZARD MITIGATION PLANNING PROCESS

1. Organize Resources- From the start, communities should focus the resources needed for a successful mitigation planning process. Essential steps include identifying and organizing interested members of the community, particularly those with the technical expertise required during the planning process.

2. Assess Risks- Communities next need to identify the characteristics and potential consequences of natural hazards. It is important to understand how much of the community can be affected by specific hazards and what the likely impacts would be for important community assets.

3. Develop a Mitigation Plan- Armed with an understanding of the risks posed by natural hazards, communities need to determine what their priorities should be and then look at possible ways to avoid or minimize the undesired effects. The result is a natural hazard mitigation plan and strategy for implementation.

4. Implement the Plan & Monitor Progress- Communities can bring the plan to life in a variety of ways ranging from implementing specific mitigation projects to changes in the day-to-day operation of the local government. To ensure the success of an on-going program, it is critical that the plan remains effective. Thus, it is important to conduct periodic evaluations and make revisions as needed.

Appendix H: Inter-Revision Updates

This plan will undergo major revisions every five years per the FEMA requirements. Kewaunee County has recognized that there may be information that should be added to the plan between the five-year updates but that the costs of continuous updates, printing and distribution cannot be excessive. This section is designed to hold that information that is gathered between the five-year updates. It is felt that only having to reproduce and distribute one section between updates will lessen the costs to the county.

Potential Areas of Concern Identified:
